I, the undersigned, hereby declare that the work was performed under my supervision and that the findings provide a true and accurate record of the results obtained.

The study was performed in accordance with the agreed protocol and with Covance Laboratories Limited Standard Operating Procedures, unless otherwise stated, and the study objectives were achieved.

The study was conducted in compliance with the United Kingdom Good Laboratory Practice Regulations 1999, Statutory Instrument No. 3106 as amended by the Good Laboratory Practice (Codification Amendments Etc.) Regulations 2004 and the OECD Principles on Good Laboratory Practice (revised 1997, issued January 1998) ENV/MC/CHEM (98) 17.

This study has been reviewed by the GLP Quality Assurance Unit of Covance and the report accurately reflects the raw data. The following inspections were conducted and findings reported to the Study Director (SD) and associated management.

Critical procedures, which are performed routinely in an operational area, may be audited as part of a "process" inspection programme. This can be in addition to phases scheduled on an individual study basis. Selected process inspections conducted and considered applicable to this study are included below.

In addition to the inspection programmes detailed below, a facility inspection programme is also operated. Details of this programme, which covers all areas of the facility annually (at a minimum), are set out in standard operating procedures.

SUMMARY

PIP silicone gel breast implants models IM GHC-TX-H, batch 16306, IM GHC-TX-H, batch 02808, IM GHC-TX-H, batch 27609, IM GHC-TX-H, batch 41609, IM GHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] were assayed for mutation in five histidine-requiring strains (TA98, TA100, TA1535, TA1537 and TA102) of *Salmonella typhimurium*, both in the absence and in the presence of metabolic activation by an Aroclor 1254-induced rat liver post-mitochondrial fraction (S-9), in two separate experiments.

All test article treatments in this study were performed using extractions of the insoluble silicone gel that comprised the inner part of each implant. Extracts were prepared in anhydrous analytical grade dimethyl sulphoxide (DMSO) or purified water for irrigation (water) at concentrations of 200 mg/mL (equivalent), with the extractions being conducted at 37°C for 72 hours, with shaking, in line with principles of ISO Guideline 10993, Part 12, 2007. As all treatments were performed using extracts of the test articles, all treatment concentrations are expressed as equivalent concentrations.

Initial non-polar (organic) vehicle extractions were conducted in hexane (in order to be consistent with chemical analysis work previously conducted for the Sponsor), however under the extraction conditions employed for this study, when the hexane was evaporated to dryness prior to resuspension in DMSO (required to have extracts in a vehicle compatible with the assay system), it was clear that the hexane had dissolved some of the silicone gel, which remained in the extraction flasks and could not be removed during the evaporation and resuspension steps. This extraction methodology was therefore not considered appropriate to prepare non-polar (organic) vehicle test article extract samples for assaying in this biological assay system. It was therefore agreed with the Sponsor that non-polar (organic) extracts for use in this study would be prepared by direct extraction in DMSO.

Experiment 1 treatments of all the tester strains with each silicone gel DMSO extract were performed in the absence and in the presence of S-9, using final concentrations of PIP silicone gel breast implants models IM GHC-TX-H, batch 16306, IM GHC-TX-H, batch 02808, IM GHC-TX-H, batch 27609, IM GHC-TX-H, batch 41609, IM GHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel extract at 200, 632.4, 2000, 6324 and 20000 µg/plate (equivalent), plus negative (blank extraction vehicle),

untreated (vehicle) and positive controls. Following these treatments there was no clear evidence of toxicity observed, but small reductions in revertant numbers at one or more of the higher treatment concentrations in strain TA1537 in the presence of S-9 with all DMSO extracts and in the absence of S-9 with some DMSO extracts may have been due to test article toxicity.

Experiment 1 treatments of all the tester strains with each silicone gel water extract were performed in the absence and in the presence of S-9, using final concentrations of PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] at 1000, 3162, 10000, 31620 and 100000 µg/plate (equivalent), plus negative (blank extraction vehicle), untreated (vehicle) and positive controls. Following these treatments, no clear evidence of toxicity was observed, but occasional small reductions in revertant numbers were observed in some strains with some water extracts (most notably in strain TA100 in the presence of S-9 with PIP silicone gel breast implant IMGHC-TX-H, batch 16306, and in strain TA102 in the presence of S-9 with PIP silicone gel breast implants IMGHC-TX-H, batch 16306 and IMGHC-TX-H, batch 27609), and these may have been the result of test article related toxic effects.

Experiment 2 treatments of all the tester strains with PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel DMSO extracts were performed in the absence and in the presence of S-9. The maximum test concentration of 20000 µg/plate (equivalent) was retained for all extracts in all strains. Narrowed concentration intervals were employed covering the range 1250 - 20000 µg/plate (equivalent), in order to examine more closely those concentrations of each silicone gel DMSO extract approaching the maximum test concentration, and considered therefore most likely to provide evidence of any mutagenic activity. In addition, all treatments in the presence of S-9 were further modified by the inclusion of a pre-incubation step. In this way, it was hoped to increase the range of mutagenic chemicals that could be detected using this assay system. Following these treatments no clear evidence of toxicity was observed.

Experiment 2 treatments of all the tester strains with PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel

water extracts were performed in the absence and in the presence of S-9. The maximum test concentration of 100000 µg/plate (equivalent) was retained for all extracts in all strains. Narrowed concentration intervals were employed covering the range 6250 - 100000 µg/plate (equivalent), in order to examine more closely those concentrations of each silicone gel DMSO extract approaching the maximum test concentration and considered therefore most likely to provide evidence of any mutagenic activity. In addition, all treatments in the presence of S-9 were further modified by the inclusion of a pre-incubation step. Following these treatments, no clear evidence of toxicity was observed, but small reductions in revertant numbers in strain TA1537 in the presence of S-9 with PIP silicone gel breast implants IMGHC-TX-H, batch 02808 and IMGHC-TX-H, batch 27609 may have been due to test article related toxicity.

All the test article water and DMSO extracts were completely soluble in the aqueous assay system at all concentrations treated, in each of the experiments performed.

Negative (vehicle; blank extraction vehicle and untreated; vehicle) and positive control treatments were included for all strains in both experiments. The mean numbers of revertant colonies all fell within acceptable ranges for negative control treatments, and were significantly elevated by positive control treatments.

Following PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel water and DMSO extract treatments of all the tester strains, in both the absence and presence of S-9, only the DMSO extract of PIP Silicone gel breast implant, model IMGHC-TX-S, batch 37908 treatments in strain TA102 in the absence of S-9 in Experiment 1, the water extract of PIP Silicone gel breast implant, model IMGHC-TX-H, batch 02808 treatments in strain TA100 in the absence of S-9 Experiment 1 and the DMSO extracts of PIP Silicone gel breast implant model IMGHC-TX-H, batch 41609 and [REDACTED] control silicone gel breast implant, model [REDACTED] treatments in strains TA100 and TA1537 respectively, in the presence of S-9 in Experiment 2, resulted in increases in revertant numbers that were statistically significant when the data were analysed at the 1% level using Dunnett's test. In each case these increases were sufficiently small in magnitude that they might reasonably be expected to have occurred due to normal biological variability, provided little or no evidence of a concentration-relationship, and were not reproduced in the corresponding other independent experiment. Accordingly, these increases were not sufficient to be considered as evidence of any test article mutagenic activity.

No other increases in revertant numbers were observed that were considered notable or were statistically significant when the data were analysed at the 1% level using Dunnett's test. This study was considered therefore to have provided no evidence of any PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 or [REDACTED] control silicone gel breast implant model [REDACTED] mutagenic activity in this assay system.

It was concluded that PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] did not induce mutation in five histidine-requiring strains (TA98, TA100, TA1535, TA1537 and TA102) of *Salmonella typhimurium* when tested under the conditions of this study. These conditions included treatments with sterile anhydrous analytical grade dimethyl sulphoxide (DMSO) and purified water for irrigation (water) extracts of silicone gel from each breast implant at concentrations up to 20000 or 100000 µg/plate (equivalent) respectively, in the absence and in the presence of a rat liver metabolic activation system (S-9).

INTRODUCTION

The Ames test is a rapid, reliable and economical method of evaluating the mutagenic potential of a test article by measuring genetic activity in one or more histidine-requiring strains of *Salmonella typhimurium* in the absence and presence of a liver metabolising system (Ames *et al.*, 1975). A large database has been accumulated with this assay, confirming its ability to detect genetically active compounds of most chemical classes with around 80-90% sensitivity and specificity (Gatehouse *et al.*, 1990). The following bacterial strains were used in this study:

Table 1: Bacterial Strains

Organism	Strain	Type of mutation in the histidine gene
<i>S. typhimurium</i>	TA98	frame-shift
<i>S. typhimurium</i>	TA100	base-pair substitution
<i>S. typhimurium</i>	TA1535	base-pair substitution
<i>S. typhimurium</i>	TA1537	frame-shift
<i>S. typhimurium</i>	TA102	base-pair substitution

With the exception of strain TA102, these strains require biotin as well as histidine for growth. In strain TA102 the critical mutation in the histidine gene is located on a multicopy plasmid pAQ1. This strain is particularly sensitive to the activities of oxidative and cross-linking mutagens. The pKM101 plasmid derivatives (TA98, TA100 and TA102) have increased sensitivity to certain mutagens as the pKM101 plasmid codes for an error-prone DNA repair system (Maron and Ames, 1983).

When exposed to a mutagen, some of the bacteria in the treated population, through chemical interaction with the compound, undergo genetic changes which cause them to revert to a non-histidine-requiring state and thus grow in the absence of exogenous histidine. Different tester strains are used because each is mutated by particular chemical classes of compound. A compound that is mutagenic in one strain need not be so in another (Garner, 1979).

The silicone gel breast implants used for this study comprised an insoluble outer shell surrounding an insoluble silicone gel, the latter (inner) part of each implant being considered as the test article. As this material is insoluble in all commonly used vehicles, extracts of each test article were prepared according to the principles of ISO Guideline 10993, Part 3, 2003 and Part 12, 2007 and assessed in this study.

The objective of this study was therefore to evaluate the potential mutagenic activity of PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] by examining their ability to revert five histidine-requiring strains of *Salmonella typhimurium* in the absence and in the presence of a rat liver metabolising system (S-9). The procedures used in this study were in accordance with OECD Guideline 471 (1997), UKEMS Guidelines (Gatehouse *et al.*, 1990), ICH-S2A (1995) and ICH-S2B (1997).

This study was performed according to the protocol and one amendment.

The study was initiated on 25 May 2012. Experimental work started on 7 June 2012 and was completed on 13 July 2012. The study completion date is considered to be the date the Study Director signs the final report.

MATERIALS

Test article

PIP silicone gel breast implants, models: IM GHC-TX-H, batch 16306, IM GHC-TX-H, batch 02808, IM GHC-TX-H, batch 27609, IM GHC-TX-H, batch 41609 and IM GHC-TX-S, batch 37908 and one [REDACTED] control silicone gel breast implant model: [REDACTED], were received on 23 May 2012 (all PIP implants) or 25 May 2012 ([REDACTED] implant) and stored at 15-30°C, protected from light. All these silicone gel breast implants were supplied as intact breast implants comprising an outer shell surrounding the inner silicone gel. The latter (inner) silicone gel component of each implant were clear white gels, and this part of the breast implant was that considered as the test article. All silicone gel samples taken for extraction throughout this study were from a single breast implant for each model/batch/manufacturer. The expiry dates of the breast implants were given as shown in the table below:

Test Article	Expiry Date
IM GHC-TX-H, batch 16306	April 2011*
IM GHC-TX-H, batch 02808	January 2013
IM GHC-TX-H, batch 27609	June 2014
IM GHC-TX-H, batch 41609	November 2014
IM GHC-TX-S, batch 37908	June 2013
[REDACTED]	October 2016.

* The Sponsor confirmed that PIP silicone breast implant Model IM GHC-TX-H, Batch 16306 was suitable for use in this study at the time of assay, despite the package expiry date having already passed.

The test article information provided by the Sponsor is considered an adequate description of the characterisation and stability of the test articles. Determinations of stability and characteristics of the test articles were the responsibility of the Sponsor. Due to the nature of the test articles (prosthetic implants) specific purity values for these materials were not considered appropriate and no certificates of analysis were provided by the Sponsor.

As the test articles were insoluble in all commonly used vehicles, extracts of the test articles were prepared according to the principles of ISO Guideline 10993, Part 3, 2003 and Part 12, 2007. The test articles were extracted at 200 mg/mL for 72 hours at 37°C, with shaking, in one polar (aqueous) vehicle (water) and one non-polar (organic) vehicle (DMSO). Maximum concentrations of 100000 µg/plate

(equivalent) (water extract) and 20000 µg/plate (equivalent) (DMSO extract) were selected for Experiment 1, in order that treatments were performed up to the maximum achievable concentrations, and therefore compliant with the requirements of current regulatory guidelines ([Gatehouse et al., 1990](#); [OECD, 1997](#); [ICH-S2A, 1995](#); [ICH-S2B, 1997](#)). Maximum concentrations of 100000 µg/plate (equivalent) (water extract) and 20000 µg/plate (equivalent) (DMSO extract) were also retained for Experiment 2.

Initial non-polar (organic) vehicle extractions were conducted in hexane (in order to be consistent with chemical analysis work previously conducted for the Sponsor), however under the extraction conditions employed for this study, when the hexane was evaporated to dryness prior to resuspension in DMSO (required to have extracts in a vehicle compatible with the assay system), it was clear that the hexane had dissolved some of the silicone gel, which remained in the extraction flasks and could not be removed during the evaporation and resuspension steps. This extraction methodology was therefore not considered appropriate to prepare non-polar (organic) vehicle test article extract samples for assaying in this biological assay system. It was therefore agreed with the Sponsor that non-polar (organic) extracts for use in this study would be prepared by direct extraction in DMSO.

For each test article, a silicone gel breast implant was initially weighed, then pierced to allow sampling of the silicone gel present within the outer shell. All operations were performed aseptically. An appropriate aliquot of the inner silicone gel for extraction was taken and cut into pieces (of approximately 1 cm³). A volume of appropriate extraction vehicle (water or DMSO) was added such that each extraction was performed at 200 mg/mL, and then extracted for 72 hours at 37°C, with shaking, in order to provide extracts that are considered an appropriate exaggeration of product use ([ISO 10993-12:2007 Biological evaluation of medical devices – Part 12](#)). For the water extracts, the resultant extracts were filter sterilised (Pall acrodisc, 0.2 µm pore size) prior to dilution or treatment. Subsequent dilutions of each extract were made using DMSO/water (as appropriate). The test article extracts were protected from light and used within approximately 7 hours of the end of the extraction period follows:

Table 2: Silicone gel breast implants concentrations tested

Experiment	S-9	Concentration of treatment extract (mg/mL)*	Final concentration (μ g/plate)*
Mutation Experiment 1	- and +	2.00	200
		6.324	632.4
		20.00	2000
		63.24	6324
		200.0	20000
Mutation Experiment 1	- and +	2.000	1000
		6.324	3162
		20.00	10000
		63.24	31620
		200.0	100000
Mutation Experiment 2	- and +	12.50	1250
		25.00	2500
		50.00	5000
		100.0	10000
		200.0	20000
Mutation Experiment 2	- and +	12.50	6250
		25.00	12500
		50.00	25000
		100.0	50000
		200.0	100000

* As all formulations were test article extracts, all concentrations should be considered as equivalent

All water extract treatments were performed using 0.5 mL volume additions per treatment, and all DMSO extract treatments were performed using 0.1 mL additions per treatment.

Analysis of achieved concentration

Duplicate samples (approximately 1 mL) of each test article extract and blank extraction vehicle on each extraction occasion were retained for analysis of achieved concentration. Samples were taken from the same bulk extraction as were used for treatment. Samples were stored at 15-25°C, protected from light, prior to dispatch of one replicate of each to the following address for analysis at the end of the experimental phase.

FAO [REDACTED]

LGC

The Health Business Park

Runcorn

Cheshire

WA7 4QX.

The remaining portion of [REDACTED] control silicone gel breast implant model [REDACTED], was also dispatched with the samples.

The remaining samples were retained at Covance. The reserve samples may be delivered and analysed if requested by the analysis site, otherwise they will be discarded after finalisation of the study report. Data generated from analysis of the extraction samples will be reported separately and does not constitute part of this report.

Controls

Negative control treatments were performed using the same addition volumes per plate as the test article treatments, 0.1 mL for DMSO extracts or 0.5 mL for water extracts, and positive control treatments were performed at volume additions of 0.1 mL for plate incorporation treatments or 0.05 mL for pre-incubation treatments. Vehicle controls comprised treatments with the blank extraction vehicle, i.e. the appropriate extraction vehicle (DMSO or water) carried through the same procedures used to extract the test articles (except without any test article present for these blank extraction vehicles), including filter-sterilisaton for the water extracts. Untreated controls were also included as further negative controls, and comprised treatments with the appropriate vehicle (DMSO or water) that had not been subject to the extraction process. The positive control chemicals were supplied and used according to the following table:

Table 3: Positive Controls

Chemical*	Stock ** concentration (μ g/mL)	Final concentration (μ g/plate)	Strain(s)	S-9
2-nitrofluorene (2NF)	50	5	TA98	-
Sodium azide (NaN_3)	20	2	TA100, TA1535	-
9-aminoacridine (AAC)	500	50	TA1537	-
Mitomycin C (MMC)	2	0.2	TA102	-
Benzo[a]pyrene (B[a]P)	100***	10	TA98	+
2-aminoanthracene (AAN)	50*** 200***	5 20	TA100, TA1535, TA1537 TA102	+

* Obtained from Sigma-Aldrich Chemical Co, Poole, UK.

** Stock solutions were formulated in water (NaN_3 and MMC), or in DMSO (2NF, AAC, AAN and B[a]P). All stock solutions were stored in aliquots protected from light at 2-8°C, with the exception of B[a]P which was stored in aliquots at <-50°C and MMC which was prepared freshly on the day of use or stored in aliquots at <-50°C.

*** Concentrations were twice that stated for the pre-incubation methodology (0.05 mL per plate).

Metabolic activation system

The mammalian liver post-mitochondrial fraction (S-9) used for metabolic activation was obtained from Molecular Toxicology Incorporated, USA where it was prepared from male Sprague Dawley rats induced with Aroclor 1254. The batches of MolTox™ S-9 were stored frozen in aliquots at <-50°C, and thawed just prior to use (Booth *et al.*, 1980). Each batch was checked by the manufacturer for sterility, protein content, ability to convert ethidium bromide and cyclophosphamide to bacterial mutagens, and cytochrome P-450-catalysed enzyme activities (alkoxyresorufin-O-dealkylase activities). The quality control statements, relating to the batches of S-9 preparation used, are included in Appendix 8 of this report.

Treatments were carried out both in the absence and presence of S-9 by addition of either buffer solution or 10% S-9 mix respectively, prepared according to the following table (per 100 mL mix):

Table 4: Buffer solution and 10% S-9 mix

Ingredient	Final content per mL in:	
	10% S-9 mix	Buffer solution
Sodium phosphate buffer pH 7.4	100 µMoles	100 µMoles
Glucose-6-phosphate (disodium)	5 µMoles	-
β-Nicotinamide adenine dinucleotide phosphate (NADP) (disodium)	4 µMoles	-
Magnesium chloride	8 µMoles	-
Potassium chloride	33 µMoles	-
Water	To volume	To volume
S-9	100 µL	-

Amino acids

The amino acid L-histidine HCl (in 250 mM MgCl₂), along with d-biotin were added, at concentrations of 20 µg and 24.4 µg per plate respectively, at the time of plating by supplementing the S-9 mix or buffer solution for plate incorporation treatments or by supplementing the soft agar for pre-incubation treatments.

Bacteria

Five strains of *Salmonella typhimurium* bacteria (TA98, TA100, TA1535, TA1537 and TA102) were used in this study. Strains TA98, TA1535 and TA1537 were originally obtained from the UK NCTC. Strains TA100 and TA102 were derived from cultures originally obtained from Covance Laboratories Inc., USA. For all assays, bacteria were cultured at 37±1°C for 10 hours in nutrient broth, containing

ampicillin (TA98, TA100) or ampicillin and tetracycline (TA102) as appropriate, to provide bacterial cultures in the range of approximately 10^8 to 10^9 cells/mL, based on cell count data from testing of each strain batch. Incubation was carried out with shaking in an anhydric incubator, set to turn on using a timer switch.

The inocula were taken from master plates or vials of frozen cultures, which had been checked for strain characteristics (histidine dependence, *rfa* character, *uvrB* character and resistance to ampicillin or ampicillin plus tetracycline). Checks were carried out according to Maron and Ames ([Maron and Ames, 1983](#)) and De Serres and Shelby ([De Serres and Shelby, 1979](#)).

METHODS

Mutation Experiments

PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] were tested for mutation (and toxicity) in five strains of *Salmonella typhimurium* (TA98, TA100, TA1535, TA1537 and TA102), in two separate experiments, at the concentrations detailed previously, using triplicate plates without and with S-9. Negative (vehicle and untreated) controls were included in quintuplicate, and positive controls were included in triplicate in both assays without and with S-9. These platings were achieved by the following sequence of additions to 2.5 mL molten agar at 46±1°C:

- 0.1 mL bacterial culture
- 0.1 mL test article extract in DMSO or control, or 0.5 mL test article extract in water or control
- 0.5 mL 10% S-9 mix or buffer solution

followed by rapid mixing and pouring on to Vogel-Bonner E agar plates. When set, the plates were inverted and incubated at 37±1°C in the dark for 3 days. Following incubation, these plates were examined for evidence of toxicity to the background lawn, and where possible revertant colonies were counted (see Colony counting).

As the results of Experiment 1 were negative, treatments in the presence of S-9 in Experiment 2 included a pre-incubation step. Quantities of test article or control solution, bacteria and S-9 mix detailed above, were mixed together and incubated for 20 minutes at 37±1°C, before the addition of 2.5 mL molten agar at 46±1°C. Additions of 0.5 mL of 500 mM sodium phosphate buffer (pH 7.4) were employed for the DMSO extract treatments in Experiment 2 in order to reduced the solvent concentrations during the pre-incubation period. In order to "correct" for the additional volume in the pre-incubation mix with these DMSO extract pre-incubation treatments, these cultures were plated out using 2 mL of 1.125 % soft agar, therefore the additions to each plate were comparable to that of the plate-incorporation treatments. DMSO, and some other organic vehicles are known to be near to toxic levels when added at volumes of 0.1 mL in this assay system when employing the pre-incubation methodology. By employing the modification indicated, the DMSO concentration in the pre-incubation mix was decreased, and thus minimised or eliminated any toxic effects of the solvent.

Plating of these treatments then proceeded as for the normal plate-incorporation procedure. In this way, it was hoped to increase the range of mutagenic chemicals that could be detected in the assay.

Colony counting

Colonies were counted electronically using a Sorcerer Colony Counter (Perceptive Instruments) or manually where confounding factors such as bubbles or splits in the agar affected the accuracy of the automated counter. The background lawn was inspected for signs of toxicity.

Analysis of results

Treatment of data

Individual plate counts from each test article extract (or control) in each vehicle in each strain in each experiment were recorded separately and the mean and standard deviation of the plate counts for each treatment were determined. Vehicle control counts were compared with the accepted normal ranges for our laboratory for numbers of spontaneous revertants on vehicle control plates ([Appendix 6](#)) and numbers of induced revertants on positive control plates ([Appendix 7](#)). Data were considered acceptable if the mean vehicle control counts fell within the historical 99% confidence intervals for group means and/or each vehicle control plate count fell within the historical 99% reference ranges, and the positive control plate counts were comparable with the historical 99% reference ranges. The ranges that are quoted are based on a large volume of historical control data accumulated from experiments where the correct strain and assay functioning are considered to have been confirmed. Data for our laboratory are consistent with ranges of spontaneous revertants per plate considered acceptable elsewhere ([De Serres and Shelby, 1979](#)).

For evaluation of test article and positive control data there are many statistical methods in use, and several are acceptable ([Venitt et al., 1983](#); [Mahon et al., 1989](#)). Dunnett's test was used to compare the counts at each concentration with the control. The presence or otherwise of a concentration response was checked by non-statistical analysis, up to limiting levels (for example toxicity, precipitation or 5000 µg/plate).

Acceptance criteria

The assay was considered valid if the following criteria were met:

1. The vehicle control counts fell within the normal ranges as defined in [Appendix 6](#).
2. The positive control chemicals induced increases in revertant numbers of ≥ 2.0 -fold (in strains TA98, TA100, or TA102) or ≥ 3.0 -fold (in strains TA1535 or TA1537) the concurrent control, confirming discrimination between different strains, and an active S-9 preparation.

Evaluation criteria

For valid data, a test article was considered to be mutagenic if:

1. When assessed using Dunnett's test, an increase in revertant numbers gave a significant response ($p \leq 0.01$) which was concentration related.
2. The positive trend/effects described above were reproducible.

A test article was considered positive in this assay if all of the above criteria were met.

A test article was considered negative in this assay if none of the above criteria were met.

Results which only partially satisfied the above criteria were dealt with on a case-by-case basis. Biological relevance was taken into account, for example consistency of response within and between concentrations and (where applicable) between experiments.

Major computer systems

The major computer systems used on this study were as follows:

Table 5: Computer systems

Activity	Computer System
Scheduling	(CMS) Covance Management Systems
Formulations	Pristima
In-life data collection	Ames Study Manager/Sorcerer
Data generation and collection	Dunnett's Data Reporter
Report generation	Microsoft Office/Adobe Acrobat

Version numbers of the systems are held on file at Covance.

RESULTS

Toxicity, solubility and concentration selection

Details of all test article extract treatment concentrations and final PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] [REDACTED] concentrations are provided in the Test article section.

Experiment 1 treatments of all the tester strains with each silicone gel DMSO extract were performed in the absence and in the presence of S-9, using final concentrations of PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel extract at 200, 632.4, 2000, 6324 and 20000 µg/plate (equivalent), plus negative (blank extraction vehicle), untreated (vehicle) and positive controls. Following these treatments there was no clear evidence of toxicity observed (as would normally be indicated by a diminution of the background bacterial lawn, and/or a marked and dose-related reduction in revertant numbers), but small reductions in revertant numbers at one or more of the higher treatment concentrations in strain TA1537 in the presence of S-9 with all DMSO extracts and in the absence of S-9 with some DMSO extracts may have been due to test article toxicity.

Experiment 1 treatments of all the tester strains with each silicone gel water extract were performed in the absence and in the presence of S-9, using final concentrations of PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] at 1000, 3162, 10000, 31620 and 100000 µg/plate (equivalent), plus negative (blank extraction vehicle), untreated (vehicle) and positive controls. Following these treatments, no clear evidence of toxicity was observed, but occasional small reductions in revertant numbers were observed in some strains with some water extracts (most notably in strain TA100 in the presence of S-9 with PIP silicone gel breast implant IMGHC-TX-H, batch 16306, and in strain TA102 in the presence of S-9 with PIP silicone gel breast implants IMGHC-TX-H, batch 16306 and IMGHC-TX-H, batch 27609), and these may have been the result of test article related toxic effects.

Experiment 2 treatments of all the tester strains with PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel DMSO extracts were performed in the absence and in the presence of S-9. The maximum test concentration of 20000 µg/plate (equivalent) was retained for all extracts in all strains. Narrowed concentration intervals were employed covering the range 1250 - 20000 µg/plate (equivalent), in order to examine more closely those concentrations of each silicone gel DMSO extract approaching the maximum test concentration, and considered therefore most likely to provide evidence of any mutagenic activity. In addition, all treatments in the presence of S-9 were further modified by the inclusion of a pre-incubation step. In this way, it was hoped to increase the range of mutagenic chemicals that could be detected using this assay system. Following these treatments no clear evidence of toxicity was observed.

Experiment 2 treatments of all the tester strains with PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel water extracts were performed in the absence and in the presence of S-9. The maximum test concentration of 100000 µg/plate (equivalent) was retained for all extracts in all strains. Narrowed concentration intervals were employed covering the range 6250 - 100000 µg/plate (equivalent), in order to examine more closely those concentrations of each silicone gel DMSO extract approaching the maximum test concentration and considered therefore most likely to provide evidence of any mutagenic activity. In addition, all treatments in the presence of S-9 were further modified by the inclusion of a pre-incubation step. Following these treatments, no clear evidence of toxicity was observed, but small reductions in revertant numbers in strain TA1537 in the presence of S-9 with PIP silicone gel breast implants IMGHC-TX-H, batch 02808 and IMGHC-TX-H, batch 27609 may have been due to test article related toxicity.

All the test article water and DMSO extracts were completely soluble in the aqueous assay system at all concentrations treated, in each of the experiments performed.

Data acceptability and validity

The individual mutagenicity plate counts were averaged to give mean values, which are presented in [Appendix 1](#), [Appendix 2](#), [Appendix 3](#) and [Appendix 4](#). From the data it can be seen that mean vehicle control counts fell within the normal historical ranges

([Appendix 6](#)). The positive control chemicals all induced increases in revertant numbers of ≥2.0-fold (in strains TA98, TA100 or TA102) or ≥3.0-fold (in strains TA1535 or TA1537) confirming discrimination between different strains, and an active S-9 preparation. The study therefore demonstrated correct strain and assay functioning and was accepted as valid.

Mutation

Following all PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] silicone gel water and DMSO extract treatments of all the tester strains, in both the absence and presence of S-9, only the DMSO extract of PIP Silicone gel breast implant, model IMGHC-TX-S, batch 37908 treatments in strain TA102 in the absence of S-9 in Experiment 1, the water extract of PIP Silicone gel breast implant, model IMGHC-TX-H, batch 02808 treatments in strain TA100 in the absence of S-9 Experiment 1 and the DMSO extracts of PIP Silicone gel breast implant model IMGHC-TX-H, batch 41609 and [REDACTED] control silicone gel breast implant, model [REDACTED] treatments in strains TA100 and TA1537 respectively, in the presence of S-9 in Experiment 2, resulted in increases in revertant numbers that were statistically significant when the data were analysed at the 1% level using Dunnett's test ([Appendix 1](#), [Appendix 2](#) and [Appendix 3](#), [Table 54](#), [Table 99](#), [Table 123](#) and [Table 138](#)). In each case these increases were sufficiently small in magnitude that they might reasonably be expected to have occurred due to normal biological variability. They also all provided little or no evidence of a concentration-relationship, and were not reproduced in the corresponding other independent experiment. Accordingly, these increases were not sufficient to be considered as evidence of any test article mutagenic activity.

No other increases in revertant numbers were observed that were considered notable or were statistically significant when the data were analysed at the 1% level using Dunnett's test. This study was considered therefore to have provided no evidence of any PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 or [REDACTED] control silicone gel breast implant model [REDACTED] mutagenic activity in this assay system when tested under the conditions employed for this study.

CONCLUSION

It was concluded that PIP silicone gel breast implants models IMGHC-TX-H, batch 16306, IMGHC-TX-H, batch 02808, IMGHC-TX-H, batch 27609, IMGHC-TX-H, batch 41609, IMGHC-TX-S, batch 37908 and [REDACTED] control silicone gel breast implant model [REDACTED] did not induce mutation in five histidine-requiring strains (TA98, TA100, TA1535, TA1537 and TA102) of *Salmonella typhimurium* when tested under the conditions of this study. These conditions included treatments with sterile anhydrous analytical grade dimethyl sulphoxide (DMSO) and purified water for irrigation (water) extracts of silicone gel from each breast implant at concentrations up to 20000 or 100000 µg/plate (equivalent) respectively, in the absence and in the presence of a rat liver metabolic activation system (S-9).

Quality control statements for S-9

MOLTOX POST MITOCHONDRIAL SUPERNATANT (S-9) QUALITY CONTROL & PRODUCTION CERTIFICATE

LOT NO.: 2920 SPECIES: Rat
PART NO.: 11-101 STRAIN: Sprague Dawley
VOLUME: 5mL SEX: Male
REFERENCE: Maron, D & Ames, B, Mutat Res 113:173, 1983
STORAGE: At or below -70°C
For Research Purposes Only

PREPARATION DATE: April 04, 2012
EXPIRATION DATE: April 04, 2014
BUFFER: 0.154 M KCl
INDUCING AGENT(s): Aroclor 1254
(Monsanto KL615), 500 mg/kg i.p.

BIOCHEMISTRY:

- PROTEIN
35.8 mg/ml

Assayed according to the method of Lowry et al., *JBC* **193**:265, 1951 using bovine serum albumin as the standard.

- ALKOXYRESORUFIN-0-DEALKYLASE ACTIVITIES

Activity	P450	Fold - Induction
----------	------	------------------

EROD	1A1, 1A2	136.0
PROD	2B1, 2B2	38.8
BROD	2B1, 2B2	57.5
MROD	1A1, 1A2	59.5

Assays for ethoxyresorufin-0-deethylase (EROD), pentoxy-, benzyl- and methoxyresorufin-0-dealkylases (PROD, BROD, & MROD) were conducted using a modification of the methods of Burke, et al., *Biochem Pharm* **34**:3337, 1985. Fold-inductions were calculated as the ratio of the sample vs. uninduced specific activities (SA's). Control SA's (pmoles/min/mg protein) were 72.8, 23.7, 95.7, & 44.2 for EROD, PROD, BROD and MROD, respectively.

BIOASSAY:**- TEST FOR THE PRESENCE OF ADVENTITIOUS AGENTS**

Samples of S-9 were assayed for the presence of contaminating microflora by plating 1.0 ml volumes on Nutrient Agar and Minimal Glucose (Vogel-Bonner E, supplemented with 0.05 mM L-histidine and D-biotin) media. Triplicate plates were read after 40 - 48 h incubation at 35 ± 2°C. The tested samples met acceptance criteria.

- PROMUTAGEN ACTIVATION

No. His ⁺ Revertants	
TA98	TA1535
184.4	1098

The ability of the sample to activate ethidium (EtBr) EtBr/CPA and cyclophosphamide (CPA) to intermediates mutagenic to TA98 and TA1535, respectively, was determined according to Lesca, et al., *Mutation Res* **129**:299, 1984. Data were expressed as revertants per µg EtBr or per mg CPA.

Dilutions of the sample S9, ranging from 0.2 - 10% in S9 mix, were tested for their ability to activate benzo(a)pyrene (BP) and 2-aminoanthracene (2-AA) to intermediates mutagenic to TA100. Assays were conducted as described by Maron & Ames, (*Mutat Res* **113**:173, 1983).

µl S9 per plate/number his⁺ revertants per plate

Promutagen	0	1	5	10	20	50
BP (5 µg)	114	223	391	506	745	1039
2-AA (2.5 µg)	139	378	1454	1973	2019	1592

MOLTOX POST MITOCHONDRIAL SUPERNATANT (S-9)
QUALITY CONTROL & PRODUCTION CERTIFICATE

LOT NO.: 2921 SPECIES: Rat
PART NO.: 11-101 STRAIN: Sprague Dawley
VOLUME: 5mL SEX: Male
TISSUE: Liver
REFERENCE: Maron, D & Ames, B. *Mutat Res* 113:173, 1983
STORAGE: At or below -70°C

PREPARATION DATE: April 05, 2012
EXPIRATION DATE: April 05, 2014
BUFFER: 0.154 M KCl
INDUCING AGENT(s): Aroclor 1254
(Monsanto KL615), 500 mg/kg i.p.

For Research Purposes Only

BIOCHEMISTRY:

- PROTEIN
38.4 mg/ml

Assayed according to the method of Lowry et al., *JBC* 193:265, 1951 using bovine serum albumin as the standard.

- ALKOXYRESORUFIN-O-DEALKYLASE ACTIVITIES

Activity	P450	Fold -	
		Induction	
EROD	1A1, 1A2	115.5	
PROD	2B1, 2B2	32.4	
BROD	2B1, 2B2	54.9	
MROD	1A1, 1A2	55.3	

Assays for ethoxyresorufin-0-deethylase (EROD), pentoxy-, benzyl- and methoxyresorufin-0-dealkylases (PROD, BROD, & MROD) were conducted using a modification of the methods of Burke, et al., *Biochem Pharm* 34:3337, 1985.
