

# A summary of the health harms of drugs

# Reader information box

Document purpose	For information
Gateway reference	16365
Title	A summary of the health harms of drugs
Author	The Centre for Public Health, Faculty of Health & Applied Social Science, Liverpool John Moore's University, on behalf of the Department of Health and National Treatment Agency for Substance Misuse
Publication date	August 2011
Target audience	Medical directors, directors of public health, allied health professionals, GPs, non-medical policy and communications teams across government, and drug treatment and recovery services, commissioners and service users
Circulation list	Government drug strategy partners, including colleagues at the FRANK drugs information and advice service, drug treatment and recovery services, clinicians, commissioners and service users
Description	A reference document summarising, for a non-medical audience, the latest scientific evidence about the health-related harms of emerging and established licit and illicit drugs commonly used in the UK
Cross reference	A summary of the health harms of drugs: technical document
Superseded documents	Dangerousness of drugs – a guide to the risks and harms associated with substance misuse
Action required	N/A
Timing	N/A
Contact details	Alex Fleming Policy information manager National Treatment Agency for Substance Misuse 6th Floor Skipton House 80 London Road London SE1 6LH alex.fleming@nta-nhs.org.uk

# A summary of the health harms of drugs

## Acknowledgements

The research team would like to thank all those who contributed to the peer review process for their constructive comments, which helped us improve the quality and content of the updated tables. We would also like to thank Alex Fleming and colleagues at the National Treatment Agency for Substance Misuse and Mark Prunty and Tara Mean from the Department of Health.

## About the research team

The research team are based at the Centre for Public Health and School of Pharmacy and Biomolecular Sciences, Liverpool John Moores University. Lisa Jones led the production of the updated tables and this report, with support from Geoff Bates and Ellie McCoy. The update of the tables was guided by a lead expert for each licit and illicit drug, comprising Mark Bellis (alcohol), Caryl Beynon (illicit opioids, tobacco), Paul Duffy (cocaine powder and freebase cocaine), Michael Evans-Brown (anabolic agents), Adam Mackridge (prescription opioids, prescription drugs and over-the-counter products) and Harry Sumnall (amphetamines and amphetamine-type stimulants, cannabis, dissociative anaesthetics, serotonergic hallucinogens, GHB and GBL, nitrites, novel synthetic drugs, khat and *Salvia divinorum*). Jim McVeigh had overall management responsibility for the delivery of the updated tables and this report.

## Declaration of interest

No member of the research team has any financial, professional or other interests to disclose that are relevant to the subject of this report, or any interests that could be significantly affected by the outcome of this work.

# Table of tables

TABLE	DRUG	ACUTE ADVERSE EFFECTS (PAGE NO.)	CHRONIC ADVERSE EFFECTS (PAGE NO.)	MEDIATING AND MODERATING FACTORS (PAGE NO.)
1.x	Alcohol	19	20	21
2.x	Amphetamines	22	23	24
3.x	MDMA and related analogues	25	26	27
4.x	Anabolic agents	28	29	30
5.x	Cannabis	31	32	33
6.x	Cocaine and crack cocaine	34	35	36
7.x	Dissociative anaesthetics	37	38	39
8.x	GHB and GBL	40	41	42
9.x	Serotonergic hallucinogens	43	44	45
10.x	Nitrites	46	47	48
11.x	Novel synthetic drugs	49	50	51
12.x	Opioids	52	53	54
13.x	Over-the-counter products	55	56	57
14.x	Khat and Salvia divinorum	58	59	60
15.x	Prescription drugs	61	62	63
16.x	Tobacco	64	65	66
17.x	Volatile substances	67	68	69
18.x	Adulterants in illicit drugs			71
19.x	Age-related factors			74
20.x	Gender-related factors			75
21.x	Route of administration			77
22.x	Polysubstance use			79

# Glossary

1,4-butanediol (1,4-BD)	See gamma-hydroxybutrate
2C series phenylamines	Derivatives of the phenethylamine class of drugs with hallucinogenic properties
abstinence	Refraining from licit and/or illicit drug use
acute effect	Effects that develops rapidly following ingestion of a drug or substance as a result of short term exposure
alcoholic cardiomyopathy	A diffuse disorder of the heart muscle seen in individuals with a history of hazardous alcohol use. Common symptoms include shortness of breath on exertion and on lying down, palpitations, swollen ankles (oedema), and abdominal distention
alcoholic cerebellar degeneration	Neurological complication characterised by unsteadiness and lack of coordination (cerebellar ataxia) predominantly affecting the lower extremities
alcoholic gastritis	Inflammation of the mucosal lining of the stomach caused by alcohol
alcoholic hepatitis	A disorder of the liver characterised by liver cell death and inflammation following chronic consumption of hazardous levels of alcohol
alcoholic pancreatitis	A disorder characterised by inflammation and destruction of the pancreas, and associated with long-term heavy alcohol consumption
amotivational syndrome	A constellation of features thought to be associated with substance use, principally cannabis use. Features include apathy, loss of effectiveness, diminished capacity to carry out complex or long-term plans, low tolerance for frustration, impaired concentration and difficulty in following routines
amphetamine	One of a class of sympathomimetic amines with powerful stimulant action on the central nervous system. The class includes amphetamine, dexamphetamine and methamphetamine
amphetamine psychosis	A disorder characterised by paranoid delusions, frequently accompanied by hallucinations, hyperactivity and mood swings. Develops during or shortly after repeated use of moderate or high doses of amphetamine
amyl nitrite	See nitrites
anabolic agents	Drugs that are used for their purported muscle-building (anabolic) effects, including anabolic-androgenic steroids and other agents with similar anabolic effects
anabolic-androgenic steroids (AAS)	A class of drugs with both muscle-building (anabolic) and masculinising (androgenic) effects
analgesic	A substance that reduces pain. Analgesics may or may not have psychoactive properties
anorectic	Causing loss of appetite
anxiolytics	Anti-anxiety drugs
arrhythmias	A disorder of the heart rate or rhythm, such as beating too fast (tachycardia), too slow (bradycardia), or irregularly. There are various types of arrhythmias depending on where problems occur along the heart's electrical conduction system
barbiturate	A group of central nervous system depressant drugs
benzodiazepine	A group of structurally related drugs used mainly as sedatives/hypnotics
blackout	A period of memory loss during which there is little recall of activities; not associated with loss of consciousness
blood alcohol level	The concentration of alcohol present in blood
butyl nitrite	See nitrites
caffeine	A mild central nervous system stimulant, vasodilator and diuretic
cannabis	Denotes psychoactive preparations of the marijuana (hemp) plant, Cannabis sativa
chronic effect	Effects arising as a consequence of repeated or long term exposure to a drug or substance
clenbuterol	An adrenergic stimulant with short-term effects similar to amphetamine. May be used alone or in combination with other substances to promote the growth of skeletal muscle (anabolic effects) and to reduce body fat (catabolic effects)
clonazepam	See benzodiazepines

CNS stimulants	A loosely defined group of drugs that tend to increase behavioural alertness, agitation, or excitation
cocaine	An alkaloid obtained from coca leaves or synthesised from ecgonine or its derivatives. A powerful central nervous system stimulant
cocaine powder	Cocaine hydrochloride, a water soluble salt
codeine containing products	Widely available as analgesic products containing codeine with aspirin, paracetamol or ibuprofen. These products may contain other ingredients such as caffeine. Cough medicines containing codeine and other ingredients are also available
convulsion	A seizure-like event characterised by loss of consciousness and muscular rigidity, followed by jerking of the limbs and trunk
crack/rock cocaine	A highly pure form of the freebase of cocaine
cross-tolerance	The development of tolerance to a substance, to which the individual has not previously been exposed, as result of acute or chronic intake of another substance
delirium	An acute organic cerebral syndrome characterised by concurrent disturbances of consciousness, attention, perception, orientation, thinking, memory, psychomotor behaviour, emotion and the sleep-wake cycle. An alcohol-induced withdrawal syndrome with delirium is known as delirium tremens
delirium tremens	Withdrawal syndrome with delirium; an acute psychotic state occurring during the withdrawal phase in people with alcohol dependence. Characterised by confusion, disorientation, paranoid ideation, delusions, illusions, hallucinations, restlessness, distractibility, tremor, sweating, tachycardia and hypertension
dependence	A cluster of symptoms that indicate a person has impaired control over their psychoactive substance use, e.g continuing use despite adverse consequences
dependence potential	The propensity of a substance to give rise to dependence
dependence syndrome	A cluster of behavioural, cognitive and physiological phenomena that may develop after repeated substance use
depressant	Any drug that suppresses, inhibits, or decreases some aspect of central nervous system activity
dexamphetamine	A central nervous system stimulant and sympathomimetic. Has been used in the treatment of narcolepsy and attention-deficit disorders and hyperactivity in children
dextromethorphan	Developed as a non-opioid cough suppressant. The main metabolite of the drug, dextrorphan, is thought to be largely responsible for the abuse potential of the drug. At high doses exerts similar actions to phencyclidine
diazepam	See benzodiazepines
disinhibition	A state of release from internal constraints on an individual's behaviour
dissociative anaesthetic	Compound, such as phencyclidine or ketamine, which produces an anaesthetic effect characterised by a feeling of being detached from the physical self
ecstasy	See MDMA
fatty liver disease	Accumulation of fat in the liver following exposure to hazardous levels of alcohol
flashbacks	A spontaneous recurrence of visual distortions, physical symptoms, loss of ego boundaries, or intense emotions that occurred during past use of hallucinogens and dissociative drugs
foetal alcohol spectrum disorder	A combination of mental and physical disabilities present at birth caused by maternal alcohol consumption during pregnancy
gamma-butyrolactone (GBL)	See GHB
gamma-hydroxybutyrate (GHB)	A naturally occurring endogenous compound. Originally synthesised for use as an anaesthetic it is used recreationally for its sedative and anaesthetic effects. The precursors of GHB, gamma-butyrolactone (GBL) and 1,4-butanediol (1,4-BD) are rapidly broken down in vivo to GHB and may also be used recreationally
growth hormone	May be used alone or in combination with other substances to induce muscle-building (anabolic) effects, reduce muscle cell breakdown and reduce body fat
hallucinations	Hallucinations involve sensing things while awake that appear to be real, but instead have been created by the mind
hallucinogen	A chemical agent that induces alterations in perception, thinking and feeling

heroin	A simple derivative of morphine. Heroin is the most widely used illicit opioid because of its potency, availability, solubility in water and speed with which it crosses the blood-brain barrier
human (and non-human) chorionic gonadotropin	Used to complement a cycle of anabolic-androgenic steroids. Their primary use is as part of the post-cycle recovery, to 'kickstart' natural testosterone production following a long cycle of AAS
illicit drug	A psychoactive substance, the production, sale, possession or use of which is prohibited
isobutyl nitrite	See nitrites
ketamine	A dissociative anaesthetic with central nervous system depressant, stimulant, analgesic, and hallucinogenic effects similar to phencyclidine, but less potent and of a shorter duration. Used in human anaesthesia and veterinary medicine. Some ketamine users may experience a terrifying feeling of almost complete sensory detachment that is likened to a near-death experience; known as the 'K-hole'
khat	The leaves of the plant, <i>Catha edulis</i> , which are chewed or brewed as a drink
legal highs	A term used to describe unregulated psychoactive substances. The term encompasses a wide range of synthetic and plant-derived substances and products, including 'research chemicals', 'party pills' and 'herbal highs', which are usually sold via the Internet or in head shops
licit drug	A drug that is legally available with or without a medical prescription
liver cirrhosis	Scarring of the liver and poor liver function
lysergic acid diethylamide (LSD)	A semi-synthetic product of lysergic acid, a natural substance from the parasitic rye fungus <i>Claviceps purpurea</i> . See serotonergic hallucinogens
MDMA	3,4-methylenedioxymethamphetamine, a synthetic derivative of amphetamine, exhibiting both stimulant and mild hallucinogenic properties. Entactogenic effects include feelings of euphoria and solidarity, heightened sensory awareness and ease of contact with others. Commonly known as ecstasy, a wide range of substances, including MDMA analogues or 4-MTA, may appear in varying concentrations in ecstasy tablets. Most ecstasy tablets now available in the UK no longer contain MDMA
mescaline	A hallucinogenic substance found in the peyote cactus in South-Western USA and North Mexico. See serotonergic hallucinogens
methadone	A synthetic opioid drug
methamphetamine	A derivative of amphetamine. The pure crystalline hydrochloride form of methamphetamine known as 'ice' may be smoked, achieving as rapid or even more rapid onset of effects than injection of methamphetamine powder (the hydrochloride salt form). Methamphetamine freebase is a colourless volatile oil insoluble in water
methylphenidate	A mild central nervous system stimulant. Commonly used in the treatment of attention-deficit disorders in children
modafinil	A wake-promoting medication used in the treatment of narcolepsy and other sleep disorders. Misused with the expectation that it will improve cognitive performance
N,N-dimethyltryptamine (DMT)	A plant hallucinogen. See serotonergic hallucinogens
nicotine	An alkaloid and the major psychoactive substance in tobacco. Nicotine has both stimulant and relaxing properties
nitrazepam	See benzodiazepines
nitrites	Volatile inhalants
non-benzodiazepine hypnotics	A class of drugs, which although chemically unrelated to the benzodiazepines, exert similar actions
novel synthetic drugs	New drugs and drug classes that have emerged since 2003. These drugs may or may not be scheduled as controlled substances and in some cases may be sold as legal highs
opioid	The generic term applied to alkaloids from the opium poppy ( <i>Papaver somniferum</i> ), their synthetic analogues, and compounds synthesised within the body
overdose	The use of any drug in such an amount that acute adverse physical or mental effects are produced
over-the-counter products	Medicines that are available without prescription

peripheral neuropathy	Disorder and functional disturbance of the peripheral nerves. Symptoms include numbness of the extremities, 'pins and needles', weakness of the limbs, or wasting of the muscles and loss of deep tendon reflexes
phencyclidine (PCP)	A psychoactive drug with central nervous system depressant, stimulant, analgesic, and hallucinogenic effects. Introduced into clinical medicine as a dissociative anaesthetic
piperazines	Initially developed as veterinary anthelmintic agents. Piperazines have a chemical structure similar to amphetamine. They have been identified in tablets sold as ecstasy. See novel synthetic drugs
polysubstance use	The use of more than one drug or type of drug by an individual, often concurrently or sequentially
psilocybin	A naturally occurring hallucinogen found in certain species of mushroom. See serotonergic hallucinogens
psychoactive drug or substance	A substance that when ingested affects mental processes, e.g. cognition or effect
psychosis	A loss of contact with reality, usually including delusions and hallucinations
psychotic	Experiencing psychosis
relapse	A return to drinking or other substance use after a period of abstinence
rhabdomyolysis	A condition caused by the breakdown of skeletal muscle fibres resulting in the release of muscle fibre content (myoglobin) into the bloodstream
route of administration	The way in which a substance is introduced into the body
Salvia divinorum	A hallucinogenic plant, the leaves of which can be chewed or smoked to release a psychoactive compound, salvinorin A
serotonergic hallucinogens	A class of hallucinogens with a method of action strongly tied to the serotonin neurotransmitter
serotonin syndrome	A potentially life threatening drug reaction that causes the body to have too much serotonin
speedball	Refers to the combined use of a stimulant and an opioid, most commonly simultaneous injection of cocaine and heroin
stimulant	Any agent that activates, enhances, or increases neural activity
substituted cathinones	Synthetic drugs with stimulant properties related to a plant product, cathinone. See novel synthetic drugs
sympathomimetic	Producing physiological effects resembling those caused by the action of the sympathetic nervous system
synthetic cannabinoids	Products typically containing synthetic cannabinoid receptor agonists sprayed onto a mixture of 'smokeable herbs'. The class of products is commonly known as 'Spice'. See novel synthetic drugs
temazepam	See benzodiazepines
THC	$\Delta^9$ -tetrahydrocannabinol, the most active constituent in cannabis
tolerance	A decrease in response to a drug dose that occurs with continued use
tryptamine derivatives	Synthetic drugs with hallucinogenic properties. Chemically related to the hallucinogen DMT. See novel synthetic drugs
volatile substances	Substances that vaporise at ambient temperatures
Wernicke–Korsakoff syndrome	A spectrum of disease resulting from vitamin B1 (thiamine) deficiency
withdrawal syndrome	A group of symptoms of variable clustering and degree of severity which occur on cessation, or reduction of use of a psychoactive substances that has been taken repeatedly, usually for a prolonged period and/or in high doses
zaleplon	See non-benzodiazepine hypnotics
zolpidem	See non-benzodiazepine hypnotics
zopiclone	See non-benzodiazepine hypnotics

# **PART ONE**

# **INTRODUCTION**

# A summary of the health harms of drugs

## 1. Introduction

The health harms arising from licit and illicit substance use and misuse are wide-ranging and vary depending on the substance used and the pattern and context of their use, but it is well established that their use represents a major public health burden. This report summarises the health-related harms of emerging and established licit and illicit drugs<sup>a</sup>, providing an update to *Dangerousness of drugs: a guide to the risks and harms associated with substance misuse*<sup>1</sup>.

### 1.1 Influence of drug, set and setting

The health harms arising from licit and illicit substance use are diverse and need to be considered within the culture and context of drug use among specific populations. That is, drug-related harms do not only vary according to the different types of drug or drugs being used; alongside this, it is the way a drug is used, the way it is used in combination with other substances, and the social context in which it is used that contribute to risk.

Researchers often consider the influence of the drug (referring to the pharmacological properties of a drug), set (the characteristics of the person using the drug) and setting (the social and physical environment in which the drug is used) on drug-related harms. For example, studies have identified specific characteristics associated with alcohol-related harm in drinking environments, including crowding, low levels of comfort, cheap drink promotions, and poorly trained staff<sup>2</sup>. These factors may also interact, as in the case of MDMA, the acute effects of which are intensified by taking it in stimulating conditions such as nightclubs<sup>3</sup>. In particular, the harms associated with illicit substance use, or use of other unregulated psychoactive substances, are further confounded by lack of suitable quality control in their manufacture and distribution. People who use these substances can therefore only make inadequate assessments of the quality, purity, and chemical composition of any drugs they use<sup>4</sup>. The route or mode of administration of a drug plays a particular role in escalating risk. Injection drug use poses the greatest risk to users, putting them at a very high risk of acquiring blood borne viral infections, and at an increased risk of overdose and dependence. Injecting drug users also frequently face discrimination and stigmatisation, which may discourage users away from accessing treatment and other health services<sup>5</sup>.

### 1.2 Assessing health-related harms

There are major challenges to the assessment of health-related harms of drugs. There may be difficulties in interpreting evidence of harm due to uncertainties whether the substance used is a direct or indirect cause of the acute and chronic adverse effects that have been attributed to its use. In addition, it may be difficult to quantify the magnitude of the risk of experiencing these health harms among users.

The methods used to develop the updated tables were based on the systematic retrieval and collection of relevant peer reviewed literature. For further details on the methodology please see the

<sup>a</sup>The list of licit and illicit drugs to be included in the updated tables was agreed between the research team, NTA and DH. For further details see the Technical Document that accompanies this report

Technical Report that accompanies this report. Evidence from systematic reviews and well designed observational studies was prioritised for inclusion, providing, where available, the strongest evidence available of an association between the substance use in question and a particular health outcome. However, it was beyond the scope of the work to provide an estimation of the magnitude of the health risks associated with each of the substances presented. Research is ongoing to develop systematic and transparent approaches for the assessment of drug-related harms<sup>6,7</sup>.

### 1.3 Patterns of substance use

Patterns of licit and illicit substance use in the general population underlie the nature and prevalence of the health harms associated with their use. The following section considers patterns of substance use reported by adults and young people in England and Wales.

#### Patterns of substance use among adults

Among 32.3 million adults aged 16 to 59 in England and Wales there are an estimated:

- 20 million weekly alcohol drinkers
- 6.8 million current smokers
- 1.6 million regular users of illicit drugs

The use and misuse of licit and illicit substances is common among the British population. The majority of adults consume alcohol: 69% and 55% of men and women in England and Wales, respectively, are weekly drinkers<sup>a</sup>; 26% of British men and 18% of British women exceed the recommended limits for weekly alcohol drinking; and 7% of men and 4% of women may be classified as higher risk drinkers<sup>b</sup>. Smoking prevalence has fallen considerably over the past three decades: 22% of men and 20% of women in England and Wales over the age of 16 currently

Figure 1. Percentage of adults reporting substance use, 2009

*Alcohol:* 16-65+ year olds who drank last week. *Smoking:* 16-60+ year olds who smoke cigarettes. *Any illicit drug:* 16-59 year olds reporting last month use of illicit drugs

Source: General Lifestyle Survey, Office for National Statistics, British Crime Survey

<sup>b</sup>Consumption of over 50 units of alcohol per week for males, and over 35 units per week for females

smoke. In addition, the proportion of heavy adult smokers (an average of 20 or more cigarettes a day) has also fallen over this period; currently 7% and 5% of men and women in England and Wales, respectively, are heavy smokers.

An estimated 36% of the adult population in England and Wales have ever used an illicit drug and 5% have used illicit drugs in the last month. Class A drug use is less common: 15% have ever used a Class A drug, with 1% having used a Class A drug in the last month<sup>9</sup>. After cigarettes and alcohol, cannabis is by far the most commonly used substance among the general population; 4% of 16 to 59-year olds have used the drug in the last month.

### Patterns of substance use among young people

Among 6.6 million young people aged 16 to 24 in England and Wales there are an estimated:

- 3.5 million weekly alcohol drinkers
- 1.7 million current smokers
- 0.8 million regular users of illicit drugs

Young adults aged 16 to 24 years are more likely to use illicit drugs than older age groups; 41% have ever used an illicit drug and 20% have used illicit drugs in the last year. Among younger age groups, 22% of 11 to 15-year olds have ever used an illicit drug and 15% have used an illicit drug in the past year. After cigarettes and alcohol, cannabis is the most commonly used substance by young people; 9% of 16 to 24-year olds and 5% of 11 to 15-year olds have used cannabis in the last month. Among 16 to 24-year olds, 5% reported using 'skunk'.

Figure 2. Percentage of young people reporting substance use, 2009

*Alcohol:* drinking during the past week. *Smoking:* current smokers (16-24yrs) and those who smoked in the past week (11-15yrs). *Any illicit drug:* those reporting use in the past month. *Cannabis:* those reporting use in the past month. *Any stimulant drug:* reported use in the past month, includes powder cocaine, crack cocaine, ecstasy, amphetamines, amyl nitrate and methamphetamine. *Any Class A drug:* reported use in the past month, includes powder cocaine, crack cocaine, ecstasy, LSD, magic mushrooms, heroin, methadone and methamphetamine

The British Crime Survey 2009-10 examined use of khat and recently classified drugs finding that in the last year among 16 to 24-year olds, 1% had used Spice or a synthetic cannabinoid, 1% had used BZP, 0.5% had used GBL/GHB and 0.5% had used khat.

### **1.4 Dependence**

There are also problems of dependence among the general population. Dependence is currently defined by the World Health Organisation International Classification of Diseases (ICD-10) as a cluster of behavioural, cognitive, and physiological phenomena which typically includes a strong desire to take the substance, difficulties in controlling its use despite harmful consequences, a higher priority given to drug use than other activities, increased tolerance, and sometimes a physical withdrawal state. The general principles of dependence do not apply equally to all psychoactive substances<sup>10</sup> and the characteristics and severity of symptoms and signs of the dependence syndrome vary by drug. In addition, harmful use may occur without a substance causing physical or psychological dependence. Ghodse notes that “dependence is not just a manifestation of a specific drug effect, but is a behaviour profoundly influenced by the individual personality and the environment, as well as by the specific drugs that are available”<sup>11</sup>. The main concepts associated with drug dependence are described below.

#### **Drug dependence**

##### **Psychological dependence**

A core component of the definition of drug dependence. Described by Ghodse (2010) as “an overriding compulsion to take the drug even in the certain knowledge that it is harmful, and whatever the consequences of the method of obtaining it” (page 7).

##### **Physical dependence**

Not all drugs cause physical dependence, but for those that do, sudden drug withdrawal is followed by a withdrawal syndrome, characteristic of the psychoactive substance taken. Whether an individual develops physical dependence varies from person to person and depends on regular administration of the drug (e.g. daily), in sufficient dosage over a period of time (e.g. a number of years).

##### **Withdrawal syndrome**

A specific array of symptoms and signs that follow sudden withdrawal of a drug that causes physical dependence.

##### **Tolerance**

Following repeated administration of some drugs, users may become less sensitive to the effects of the drug and over time require larger doses to achieve the same effects previously produced at lower doses. Therefore, they may be able to tolerate much higher doses than individuals who have not previously been exposed to the drug. Tolerance does not necessarily develop equally or at the same rate for all the effects of a drug.

Among 33.7 million adults aged 16 to 64 in England there are:

- 2.4 million adults who show signs of dependence on alcohol
- 1.4 million adults who show signs of dependence on illicit drugs

Among the general population, alcohol dependence affects 9% of men and 3% of women in England and 24% of adults drink alcohol in a way that puts them at risk of physical and psychological harm<sup>12</sup>. There is a continuing debate about how best to characterise nicotine dependence among tobacco smokers<sup>13</sup>. One indicator of dependence is how soon after waking smokers smoke their first cigarette. Among the general population, 15% of smokers have their first cigarette within the first five minutes of waking<sup>14</sup>.

General population surveys estimate that around 3% of adults in England show signs of dependence on illicit drugs, most frequently cannabis (4% of men and 2% of women)<sup>12</sup>. For other illicit drugs, 0.4% show signs of dependence on cocaine and 0.1% each show signs of dependence on crack, ecstasy and heroin/methadone. However, general population surveys significantly underestimate the numbers of dependent drug users; based on estimates of opiate and crack cocaine use, there are over 320,000 opiate and/or crack cocaine users in England (equivalent to approximately 0.9% of the population).

## 1.5 Substance-related deaths

### Alcohol

Alcohol use has been linked to the development of a number of chronic conditions and acute consequences, ranging from cancer to road traffic accidents. There were 7,075 alcohol-related deaths in England and Wales in 2009, if only the causes of death regarded as being most directly due to alcohol consumption are included<sup>c</sup>. There were more alcohol-related deaths among men than women; 4,649 deaths among men and 2,426 deaths among women.

Using a broader definition of alcohol-related deaths, the North West Public Health Observatory estimated that in 2005 there were 14,982 deaths attributable to alcohol consumption<sup>15</sup>, representing 3% of all deaths in England for that year. Alcohol-related deaths varied by age, and young people were disproportionately affected by their alcohol use. For example, among males it was estimated that 27% of deaths among 16-24 year olds were attributable to alcohol consumption.

### Smoking

Smoking-related deaths have been attributed to a range of diseases including cardiovascular disease, respiratory disease (including chronic obstructive pulmonary disorder) and lung cancer. Nineteen per cent of all deaths in the UK were estimated to be directly attributable to smoking in 2005<sup>16</sup>. In 2009, an estimated 81,400 deaths among adults aged 35 and over were attributable to smoking, representing 18% of all deaths for that year<sup>17</sup>.

### Illicit drugs

The majority of recorded drug-related deaths are related to opioid use and mostly occur among injecting drug users<sup>18</sup>. In 2009<sup>19</sup>, there were 2,878 deaths in England and Wales related to drug poisoning and 1,876 drug misuse deaths<sup>d</sup>. Of deaths from drug-related poisoning, 880 involved

<sup>c</sup>Based on the current Office for National Statistics definition of alcohol-related deaths

<sup>d</sup>Defined as deaths where the underlying cause is drug abuse or drug dependence or deaths where the underlying cause is drug poisoning and where any of the substances controlled under the Misuse of Drugs Act (1971) are involved

heroin or morphine, 378 deaths involved methadone, 261 involved benzodiazepines and 202 involved cocaine. An alternative source of data on drug-related deaths is published by the National Programme on Substance Abuse Deaths (np-SAD). In 2009, there were 1,524 drug-related deaths in England reported to the programme<sup>20</sup>. The main cause of death was accidental poisoning and heroin/morphine were the principle substances implicated in deaths.

However, neither of these sources take into account other deaths related to illicit drug use such as those from blood borne infections, violent assaults, and suicides. For example, deaths from AIDS among injecting drug users accounted for 8% of all AIDS deaths in England and Wales in 2009<sup>21</sup>.

## **1.6 The economic costs of substance use**

### **Health care**

Studies of the health-related costs of substance use indicate an annual spend of nearly £3bn on alcohol misuse in England<sup>22</sup>, in the region of £5 billion on smoking-related ill health in the UK<sup>16</sup>, and just under £500m on Class A drug use in England and Wales<sup>23</sup>. Hospital admissions arising from diseases or conditions directly and indirectly related to substance use make a large contribution to the costs to the NHS. The most recent data available indicates that each year there are over one million admissions related to alcohol consumption<sup>24</sup>, and over 45,000 admissions attributable to smoking among people over 35<sup>17</sup>. In relation to illicit drug use, there are around 5,800 admissions for drug-related mental health and behavioural disorders<sup>e</sup> each year and over 11,500 admissions for drug poisoning<sup>25</sup>. These statistics, however, do not take into account other types of drug-related hospital admissions, for example, those related to respiratory disease, HIV-related illness, chronic liver disease associated with hepatitis C infection and injection site infections. In addition, older people who continue to use drugs and require the support of health services are emerging as an important but relatively under-researched population.<sup>26</sup>

### **Substance-related crime**

Although it is difficult to estimate the number of offences that are related to alcohol or illicit drug use, it is well established that there is a link between substance use and acquisitive crime. The 2005 Offending Crime and Justice Survey<sup>27</sup> included questions on offending among young people aged 10 to 25 years related to alcohol and illicit drug use. For 18% of all violent offences and 10% of all property offences, offenders were under the influence of alcohol only. For 3% and 2% of all violent offences and all property offences, respectively, offenders were under the influence of illicit drugs only.

In 2008, the Home Office calculated that the costs associated with alcohol-related crime were between £8.75bn and £14.78bn<sup>28</sup>. These costs were mainly incurred as a result of less serious wounding, criminal damage, sexual offences and causing death by dangerous driving. The costs associated with drug-related crime were last updated in 2003-04 and estimated at £13.32bn<sup>23</sup>. The estimation of these costs included the following offence categories: fraud, burglary, robbery and shoplifting.

<sup>e</sup>Including admissions for acute intoxication, harmful use, dependence syndrome, withdrawal state, psychotic disorder, amnesic syndrome and other disorders

### **1.7 The updated tables**

The basic layout of the updated tables follows the 'framework for typology of dangerousness of drugs' as outlined in the 2003 report, focusing on the acute and chronic adverse effects associated with each substance and factors that mediate or moderate the risk.

Following the format of the 2003 report, evidence on specific harms associated with different contextual factors related to drug use (different routes of administration, polypharmacy, and age and gender-related factors) have been included in the updated tables for each specific drug, and as a set of new tables addressing these as cross-cutting themes across the included substances. Two additional tables also consider the potential health risks arising from adulterants.

# **PART TWO**

# **THE UPDATED TABLES**

# 1. Alcohol

## 1.1 Acute adverse effects associated with the use of alcohol

PHYSICAL		PSYCHOLOGICAL/PSYCHIATRIC

# 15. Prescription drugs

## 15.3 Factors that mediate and moderate harms associated with the use of prescription drugs

ROUTE OF ADMINISTRATION/ DOSE	COMBINATION USE (CONCURRENT USE, CONSECUTIVE USE)	AVAILABILITY/ PURITY	SOCIAL CONTEXT/ SETTING	AGE/ DEVELOPMENTAL ISSUES	INDIVIDUAL VULNERABILITY	LEGAL SITUATION
<p><b>Benzodiazepines</b></p> <p><u>Route of administration</u></p> <ul style="list-style-type: none"> <li>risk historically associated with use by injection – blocking of peripheral veins in arms, legs, skin abscesses, deep vein thrombosis</li> </ul> <p><b>Non-benzodiazepine hypnotics</b></p> <p><u>Route of administration</u></p> <ul style="list-style-type: none"> <li>orally, intravenously or by crushing or snorting it</li> </ul> <p><b>CNS stimulants</b></p> <p><u>Route of administration</u></p> <ul style="list-style-type: none"> <li>methylphenidate and dexamphetamine used orally, by injection, or by snorting</li> <li>injecting complications related to insoluble excipients in tablets</li> </ul>	<p><b>Benzodiazepines</b></p> <p><u>Concurrent use</u></p> <ul style="list-style-type: none"> <li>in combination with opioids – increased risk of drug use</li> <li>use in combination with alcohol increases the risk of withdrawal fits, which can be fatal</li> <li>opioid users may use benzodiazepines for their pharmacological effects and to augment the effects of weak heroin</li> </ul> <p><b>Non-benzodiazepine hypnotics</b></p> <ul style="list-style-type: none"> <li>suggestion that may be used by drug users as a replacement for benzodiazepines</li> </ul> <p><b>CNS stimulants</b></p> <p><u>Concurrent use</u></p> <ul style="list-style-type: none"> <li>US college settings – reports of combined use of methylphenidate with alcohol and/or cannabis</li> </ul>	<p><b>Benzodiazepines and non-benzodiazepine hypnotics</b></p> <p><u>Availability</u></p> <ul style="list-style-type: none"> <li>long term prescribing increases risk of dependence</li> <li>dose related factors</li> <li>effective importation policies have reduced availability of illegal imports</li> </ul>	<p><b>Benzodiazepines and non-benzodiazepine hypnotics</b></p> <p><u>Social context</u></p> <ul style="list-style-type: none"> <li>social use rare among long-term prescription users</li> </ul> <p><b>CNS stimulants</b></p> <p><u>Social context/ setting</u></p> <ul style="list-style-type: none"> <li>methylphenidate use has been reported in US college settings to enhance study, as well as recreationally</li> </ul>	<p><b>Benzodiazepines and non-benzodiazepine hypnotics</b></p> <p><u>Age</u></p> <ul style="list-style-type: none"> <li>early use has been noted in some adolescent groups, but this has tended to be localised</li> </ul> <p><b>CNS stimulants</b></p> <p><u>Age</u></p> <ul style="list-style-type: none"> <li>risk of serious life-threatening skin reactions with modafinil in children</li> </ul>	<p><b>Benzodiazepines</b></p> <ul style="list-style-type: none"> <li>overdose risk may be enhanced by concurrent depressant drug use</li> </ul> <p><b>CNS stimulants</b></p> <ul style="list-style-type: none"> <li>higher risk of abuse among people with a history of substance abuse or psychiatric problems</li> </ul>	<p><u>Misuse of Drugs Act 1971</u></p> <p><u>Class B</u> dexamphetamine, methylphenidate</p> <p><u>Class C</u> benzodiazepines, zolpidem</p> <p><u>Not controlled</u> zopiclone, zaleplon, modafinil</p>

# 16. Tobacco

## 16.1 Acute adverse effects associated with the use of tobacco

PHYSICAL		PSYCHOLOGICAL/PSYCHIATRIC
MORTALITY	MORBIDITY	
<p><u>Death by nicotine poisoning</u></p> <ul style="list-style-type: none"> <li>• rare, occurs in children or non-smokers</li> </ul> <p><u>Accidental death</u></p> <ul style="list-style-type: none"> <li>• can be caused by fires that may result from smoking</li> </ul>	<p><u>Sympathetic over-activation</u></p> <ul style="list-style-type: none"> <li>• especially among novice users</li> <li>• palpitations</li> <li>• sweating</li> <li>• tremor</li> <li>• nausea</li> <li>• dizziness</li> </ul> <p><u>Respiratory complications</u></p> <ul style="list-style-type: none"> <li>• irritant effects of smoke on respiratory system</li> </ul> <p><u>Injury</u></p> <ul style="list-style-type: none"> <li>• injury resulting from fires</li> </ul> <p><u>Oral tobacco use</u></p> <p><u>Acute complications</u></p> <ul style="list-style-type: none"> <li>• irritant effects on site of absorption</li> </ul>	<p><u>Personality/mood</u></p> <ul style="list-style-type: none"> <li>• increased anxiety</li> <li>• mood disturbance</li> <li>• increased irritability during periods of enforced abstinence</li> </ul>

# 16. Tobacco

## 16.2 Chronic adverse effects associated with the use of tobacco

PHYSICAL		PSYCHOLOGICAL/PSYCHIATRIC	DEPENDENCE/ WITHDRAWAL/ TOLERANCE
MORTALITY	MORBIDITY		
<p><u>Cardiovascular disease</u></p> <ul style="list-style-type: none"> <li>coronary heart disease</li> <li>peripheral vascular disease</li> <li>blood clots may form in the arteries supplying the heart (coronary thrombosis) or the brain (cerebral thrombosis) leading to a heart attack or stroke</li> </ul> <p><u>Cancers</u></p> <ul style="list-style-type: none"> <li>lung</li> <li>digestive tract (mouth, tongue, throat and oesophagus)</li> </ul> <p><u>Respiratory disease</u></p> <ul style="list-style-type: none"> <li>chronic obstructive pulmonary disease, defined by a long-term cough with mucus (chronic bronchitis) and/or destruction of the lungs over time (emphysema)</li> <li>death from slow and progressive breathlessness</li> </ul> <p><u>Accidents</u></p> <ul style="list-style-type: none"> <li>fires are an important cause of accidental death that may result from smoking</li> </ul> <p><u>Exposure to second hand smoke</u></p> <ul style="list-style-type: none"> <li>coronary heart disease and lung cancer among adults</li> </ul>	<p><u>Cancers strongly linked to smoking</u></p> <ul style="list-style-type: none"> <li>cancer of lung, mouth, pharynx, larynx</li> <li>cancer of oesophagus, bladder, kidney, pancreas</li> <li>cancer of stomach, liver, cervix, nose, lip</li> </ul> <p><u>Vascular complications</u></p> <ul style="list-style-type: none"> <li>chronic obstructive pulmonary disease</li> <li>heart attack</li> <li>abdominal aortic aneurysm</li> <li>coronary artery disease</li> <li>peripheral vascular disease</li> <li>stroke</li> </ul> <p><u>Other diseases/conditions</u></p> <ul style="list-style-type: none"> <li>pneumonia</li> <li>peptic ulcer</li> <li>periodontal disease</li> <li>osteoporosis</li> <li>macular degeneration, cataracts</li> </ul> <p><u>Minor ailments</u></p> <ul style="list-style-type: none"> <li>decreased exercise tolerance</li> <li>weight loss</li> <li>bad breath (halitosis)</li> <li>increased susceptibility to coughs and colds</li> <li>increased signs of ageing</li> </ul> <p><u>Reproductive disorders</u></p> <ul style="list-style-type: none"> <li>decreased fertility in males and females</li> <li>smoking in pregnancy associated with increased risk of miscarriage, perinatal mortality and low birth weight</li> </ul> <p><u>Exposure to second hand smoke</u></p> <p>Among adults:</p> <ul style="list-style-type: none"> <li>lung cancer</li> <li>coronary heart disease</li> </ul> <p>Among infants and children:</p> <ul style="list-style-type: none"> <li>infections of the lower respiratory tract</li> <li>middle ear disease</li> <li>major respiratory symptoms (cough, phlegm, wheeze and breathlessness)</li> <li>asthma</li> <li>reduced lung function</li> </ul>	<p><u>Association with mental health disorders</u></p> <ul style="list-style-type: none"> <li>strong association between mental health disorders, including schizophrenia and mood disorders, and tobacco smoking</li> </ul> <p><u>Significant risk factor for dementia</u></p> <ul style="list-style-type: none"> <li>Alzheimer's disease</li> <li>other types of dementias</li> <li>evidence of cognitive decline among elderly smokers</li> </ul>	<p><u>Dependence</u></p> <ul style="list-style-type: none"> <li>good evidence for a nicotine dependence syndrome</li> <li>nicotine is comparatively more likely to cause dependence among users than other psychoactive substances including alcohol, heroin, cocaine and cannabis</li> </ul> <p><u>Withdrawal</u></p> <ul style="list-style-type: none"> <li>craving for nicotine</li> <li>anxiety</li> <li>irritability</li> <li>frequent changes in mood (emotional lability)</li> <li>inability to concentrate</li> <li>insomnia</li> <li>increased appetite</li> </ul> <p><u>Tolerance</u></p> <ul style="list-style-type: none"> <li>rapid development of tolerance to adverse effects e.g. nausea</li> <li>acute tolerance to effects on heart rate</li> <li>no tolerance to peripheral vasoconstriction</li> <li>acute tolerance to the subjective sensations of nicotine (i.e. the 'pleasurable' effects of smoking)</li> </ul>

# 16. Tobacco

## 16.3 Factors that mediate and moderate harms associated with the use of tobacco

ROUTE OF ADMINISTRATION/ DOSE	COMBINATION USE (CONCURRENT USE, CONSECUTIVE USE)	AVAILABILITY/ PURITY	SOCIAL CONTEXT/ SETTING	AGE/ DEVELOPMENTAL ISSUES	INDIVIDUAL VULNERABILITY	LEGAL SITUATION
<u>Route of administration</u> <ul style="list-style-type: none"> <li>smoked</li> <li>use of filters in some cigarettes</li> <li>increased tobacco use in pipes and roll-ups</li> <li>varies as a function of intensity of inhalation</li> </ul>	<u>Consecutive use</u> <ul style="list-style-type: none"> <li>cigarette smoking is a relapse risk in drinkers</li> </ul>	<u>Availability</u> <ul style="list-style-type: none"> <li>age limit of 18 on purchase</li> <li>increased availability and reduced price associated with illegal importation of illicit tobacco</li> </ul>	<u>Social context/ setting</u> <ul style="list-style-type: none"> <li>smoking is common among opioid users</li> <li>frequent use among drinkers</li> </ul>	<u>Age</u> <ul style="list-style-type: none"> <li>early onset of smoking and drinking clearly linked to earlier onset and more regular use of illicit drugs in adolescents and more difficulty in quitting as an adult</li> </ul>	<ul style="list-style-type: none"> <li>the stimulating effects of nicotine on cardiovascular system can be detrimental to people with cardiovascular or respiratory disease</li> </ul>	Not controlled under Misuse of Drugs Act 1971

# 17. Volatile substances\*

## 17.1 Acute adverse effects associated with the use of volatile substances

PHYSICAL		PSYCHOLOGICAL/PSYCHIATRIC
MORTALITY	MORBIDITY	
<p><u>Acute complications</u></p> <ul style="list-style-type: none"> <li>• toxicity varies greatly with the specific substance and causes of fatalities are unclear</li> <li>• most fatalities involve physiological depression of the central nervous system, accidents (falls, drowning, fire) or sudden death related to abnormal heart rhythms (cardiac arrhythmia)</li> <li>• may lose consciousness and die through choking on own vomit</li> <li>• danger from suffocation if plastic bag placed over head to inhale</li> <li>• intense cooling in mouth caused by squirting lighter fuel down throat may result in laryngeal spasm blocking airways and causing death by asphyxiation, or by profound slowing of the heart via vagal action</li> </ul>	<p><u>Acute intoxication</u></p> <ul style="list-style-type: none"> <li>• adverse effects vary greatly with the specific substance and mode of administration                             <ul style="list-style-type: none"> <li>– flushed face and neck</li> <li>– cold sweats</li> <li>– loss of balance, unsteadiness and lack of coordination</li> <li>– fainting</li> <li>– headache</li> <li>– nausea, vomiting</li> <li>– confusion, dizziness, disorientation</li> <li>– tachycardia, palpitations</li> <li>– drowsiness, sedation, unconsciousness</li> <li>– risk of accidental injury while intoxicated</li> </ul> </li> </ul>	<p><u>Personality/mood</u></p> <ul style="list-style-type: none"> <li>• confusional states, disorientation</li> <li>• distorted perceptions, delusions, hallucinations, pseudo hallucinations</li> <li>• aggression, agitation and fear</li> </ul>

\*Glues, thinners, aerosols, paints and lighter fuel

# 17. Volatile substances

## 17.2 Chronic adverse effects associated with the use of volatile substances

PHYSICAL		PSYCHOLOGICAL/PSYCHIATRIC	DEPENDENCE/ WITHDRAWAL/ TOLERANCE
MORTALITY	MORBIDITY		
<ul style="list-style-type: none"> <li>not documented, limited evidence base</li> </ul>	<p><u>Chronic complications</u></p> <ul style="list-style-type: none"> <li>no consistent pattern – unclear why some users are affected and others are not</li> <li>peripheral and central neurological damage</li> <li>kidney failure</li> <li>liver toxicity</li> <li>severe gastrointestinal upset</li> <li>muscle damage</li> <li>very long term (e.g. 10 years) solvent misuse may result in lasting impairment of brain function (especially affecting control of movement)</li> </ul> <p><u>Pregnancy</u></p> <ul style="list-style-type: none"> <li>use during pregnancy may increase the risk of adverse outcomes</li> <li>suggestion that use may be associated with a neonatal withdrawal syndrome</li> </ul> <p><u>Substance specific – petrol</u></p> <p><u>Chronic complications</u></p> <ul style="list-style-type: none"> <li>lead poisoning</li> </ul>	<p><u>Organic/neurological</u></p> <ul style="list-style-type: none"> <li>decreased ability to concentrate</li> </ul> <p><u>Personality/mood</u></p> <ul style="list-style-type: none"> <li>insomnia</li> <li>nightmares</li> </ul>	<p><u>Dependence</u></p> <ul style="list-style-type: none"> <li>evidence that volatile substance users experience signs and symptoms of a dependence syndrome is limited</li> </ul> <p><u>Withdrawal</u></p> <ul style="list-style-type: none"> <li>reports in the literature of a withdrawal syndrome similar to alcohol withdrawal</li> <li>irritability, headaches</li> </ul> <p><u>Tolerance</u></p> <ul style="list-style-type: none"> <li>develops within 2 to 3 weeks of persistent use but is lost after a few days of abstinence</li> </ul>

# 17. Volatile substances

## 17.3 Factors that mediate and moderate harms associated with the use of volatile substances

ROUTE OF ADMINISTRATION/ DOSE	COMBINATION USE (CONCURRENT USE, CONSECUTIVE USE)	AVAILABILITY/ PURITY	SOCIAL CONTEXT/ SETTING	AGE/ DEVELOPMENTAL ISSUES*	INDIVIDUAL VULNERABILITY	LEGAL SITUATION
<u>Route of administration</u> <ul style="list-style-type: none"> <li>inhaled</li> <li>method of placing plastic bags completely over the heads increases risk of suffocation</li> <li>some substances (e.g. butane) may be sprayed directly down the throat – practice has been associated with cases of sudden death</li> </ul>	<u>Concurrent use</u> <ul style="list-style-type: none"> <li>use with alcohol and other central nervous system depressants will bring increased risk of asphyxiation and death</li> </ul>	<u>Availability</u> <ul style="list-style-type: none"> <li>widely available in the household and shops (newsagents, chemists, supermarkets)</li> <li>commercially available cans of lighter fuel are the most common cause of volatile substance abuse deaths</li> </ul>	<u>Setting</u> <ul style="list-style-type: none"> <li>risk of injury when consumed alone in potentially dangerous locations – e.g. near water (risk of drowning), on a high building (risk of falls)</li> <li>risk of death when consumed alone – e.g. from the consequences of an abnormal heart rhythm (arrhythmia)</li> </ul>	<u>Age</u> <ul style="list-style-type: none"> <li>volatile substances are unique among substances of abuse as the main abusers are children and adolescents (aged 10 to 18 years)</li> </ul>	<ul style="list-style-type: none"> <li>behavioural problems, learning difficulties</li> <li>poor general physical health</li> <li>increased risk of involvement with problem alcohol and tobacco use</li> </ul>	Not controlled under Misuse of Drugs Act 1971

# **PART THREE**

## **CROSS-CUTTING THEMES**

# 18. Adulterants in illicit drugs\*

## 18.1 Adulterants commonly identified in illicit drugs

ADULTERANT(S)/ LICIT USE	POTENTIAL REASON FOR PRESENCE AS ADULTERANT	POTENTIAL PUBLIC HEALTH RISKS	HEALTH EFFECTS ASSOCIATED WITH USE OF ADULTERATED ILLICIT DRUGS IDENTIFIED IN CASE REPORTS
<u>Sucrose, lactose, dextrose and mannitol</u> • sugars	<ul style="list-style-type: none"> <li>commonly used to dilute/add bulk to heroin and cocaine</li> <li>legally and readily available</li> </ul>	<ul style="list-style-type: none"> <li>inactive adulterants</li> </ul>	<ul style="list-style-type: none"> <li>none reported</li> </ul>
<u>Lead</u> • soft, malleable metal	<p><b>Heroin</b></p> <ul style="list-style-type: none"> <li>potentially a by-product of the use of lead pots in illicit heroin manufacture</li> </ul> <p><b>Methamphetamine</b></p> <ul style="list-style-type: none"> <li>sometimes used in methamphetamine manufacture; poor manufacturing can result in lead residue in the drug product</li> </ul>	<ul style="list-style-type: none"> <li>in low dosages lead poisoning can have mild effects</li> <li>injecting illicit drugs adulterated with lead causes severe adverse health effects</li> </ul>	<p><u>Lead poisoning</u></p> <p>Symptoms may include:</p> <ul style="list-style-type: none"> <li>abdominal pain and cramping</li> <li>headaches</li> <li>anaemia</li> <li>dizziness</li> <li>nausea/vomiting</li> <li>muscle weakness</li> <li>convulsions</li> <li>coma</li> <li>kidney damage</li> <li>damage to the central nervous system</li> </ul>
<u>Caffeine</u> • psychoactive stimulant drug	<p>Caffeine is legal, cheap and more readily available than illicit drugs.</p> <p><b>Heroin</b></p> <ul style="list-style-type: none"> <li>vaporizes heroin at lower temperature when smoked – slightly increases efficiency</li> </ul> <p><b>Cocaine, amphetamine, methamphetamine and ecstasy</b></p> <ul style="list-style-type: none"> <li>stimulant properties of caffeine can create similar, although usually milder, effects to stimulant drugs</li> </ul>	<ul style="list-style-type: none"> <li>in small doses there are few serious health repercussions</li> <li>moderate to large doses can cause considerable harms (e.g. mood disturbances, anxiety, sleep disturbance)</li> </ul>	<ul style="list-style-type: none"> <li>none reported</li> </ul>
<u>Procaine</u> • local anaesthetic	<p><b>Heroin</b></p> <ul style="list-style-type: none"> <li>facilitates smoking of heroin</li> <li>may relieve the pain of intravenous injection due to anaesthetic properties</li> </ul> <p><b>Cocaine</b></p> <ul style="list-style-type: none"> <li>similar anaesthetic and subjective effects as cocaine</li> </ul>	<ul style="list-style-type: none"> <li>risk of toxicity at high doses (e.g. nausea, vomiting, dizziness, tremors, convulsions, anxiety)</li> </ul>	<ul style="list-style-type: none"> <li>none reported</li> </ul>
<u>Paracetamol</u> • over-the-counter analgesic	<p>Paracetamol is legal, easily available and relatively cheap</p> <p><b>Heroin</b></p> <ul style="list-style-type: none"> <li>analgesic effects and bitter taste of paracetamol may disguise poor quality heroin</li> <li>may be used because it has similar melting point to heroin</li> </ul>	<ul style="list-style-type: none"> <li>low dosages should have minimal impact</li> <li>risk of liver toxicity at high doses</li> </ul>	<ul style="list-style-type: none"> <li>none reported</li> </ul>
<u>Strychnine</u> • pesticide	<p>Fine motor stimulant; at low doses acts as a muscle stimulant</p> <p><b>Heroin</b></p> <ul style="list-style-type: none"> <li>enables greater retention of heroin when volatilized (the process of smoking heroin)</li> <li>has only been found at non-life threatening quantities.</li> </ul> <p><b>Cocaine</b></p> <ul style="list-style-type: none"> <li>reason for inclusion unknown – may have been unintentional</li> </ul>	<ul style="list-style-type: none"> <li>has only been reported in non-life-threatening quantities</li> <li>small increases could potentially be fatal</li> </ul>	<p><u>Strychnine poisoning</u></p> <p>Symptoms may include:</p> <ul style="list-style-type: none"> <li>muscle spasm</li> <li>a form of spasm in which the head, neck and spine are arched backwards (opisthotonus)</li> </ul>

\*Tables 18.1 and 18.2 summarise the findings of an evidence-based overview of adulterants in illicit drugs (Cole et al., 2010), and their associated adverse health effects. It should be noted that adulterants in illicit drugs are predominantly substances which are legal, readily available, and likely to have minimal impact on users' health at low dosages. However, the methods currently used to analyse illicit drug samples mean that it is not possible to determine how commonly adulterants are present in illicit drugs at doses likely to cause harm.

# 18. Adulterants in illicit drugs

## 18.2 Adulterants identified in particular illicit drugs

ADULTERANT(S)/ LICIT USE	POTENTIAL REASON FOR PRESENCE AS ADULTERANT	POTENTIAL PUBLIC HEALTH RISKS	HEALTH EFFECTS ASSOCIATED WITH USE OF ADULTERATED ILLICIT DRUGS IDENTIFIED IN CASE REPORTS
<b>Heroin</b>			
<u>Phenobarbital</u> • barbiturate	<ul style="list-style-type: none"> <li>• psychoactive drug</li> <li>• facilitates smoking of heroin</li> </ul>	<ul style="list-style-type: none"> <li>• risk of adverse effects and death from large doses (e.g. disorders of the liver, respiratory depression, mood disturbances)</li> <li>• may be life-threatening in injecting drug users who are hypersensitive to phenobarbital</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>
<u>Quinine</u> • antimalarial medication	<ul style="list-style-type: none"> <li>• bitter taste similar to heroin and may be used as a diluents</li> <li>• mimics the respiratory 'rush' felt by injecting heroin users shortly after administration</li> </ul>	<ul style="list-style-type: none"> <li>• adverse effects from large doses are serious and may be life-threatening (e.g. acute renal failure; cinchonism including tinnitus, hearing impairment, vertigo, vomiting, diarrhoea, visual disturbances, confusion; muscle weakness)</li> <li>• can also cause a host of other adverse health reactions including acute kidney failure, gastric disturbances and cardiovascular complications</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>
<u>Clenbuterol</u> • asthma decongestant and bronchodilator drug	<ul style="list-style-type: none"> <li>• reason for inclusion unknown</li> <li>• may be related to unintentional contamination</li> </ul>	<ul style="list-style-type: none"> <li>• can cause poisoning at moderate to high dosages</li> <li>• low doses typically cause adverse cardiovascular effects (e.g. increase in heart rate, blood pressure)</li> </ul>	<ul style="list-style-type: none"> <li>• cardiovascular effects</li> <li>• novel neuromuscular syndrome characterised by muscle spasm and overactive or overresponsive reflexes (hyperreflexia)</li> </ul>
<u>Scopolamine</u> • anticholinergic alkaloid	<ul style="list-style-type: none"> <li>• colourless, odourless and tasteless</li> <li>• not easily detectable</li> </ul>	<ul style="list-style-type: none"> <li>• low doses cause sleepiness and drowsiness</li> <li>• high doses can cause euphoria</li> </ul>	<u>Anticholinergic toxicity</u> Complications include: <ul style="list-style-type: none"> <li>• blurred vision</li> <li>• agitation</li> <li>• fever</li> <li>• urinary retention</li> <li>• flushed skin</li> <li>• dilated pupils</li> </ul>
<b>Cocaine</b>			
<u>Local anaesthetics</u> • e.g. lidocaine, benzocaine and procaine	<ul style="list-style-type: none"> <li>• similar (stronger) anaesthetic effects as cocaine</li> <li>• gives the impression of higher quality cocaine</li> </ul>	<ul style="list-style-type: none"> <li>• adverse cardiovascular and central nervous system reactions can occur at low doses</li> <li>• adverse effects from a large dose(s) are serious and may be life-threatening</li> <li>• increases the toxicity of cocaine</li> </ul>	<ul style="list-style-type: none"> <li>• difficulty circulating oxygen through the blood stream (methaemoglobinaemia)</li> </ul>
<u>Phenacetin</u> • analgesic	<ul style="list-style-type: none"> <li>• pain relieving properties</li> <li>• similar physical properties to cocaine</li> </ul>	<ul style="list-style-type: none"> <li>• banned in many countries due to links with kidney failure and suspected carcinogenicity</li> </ul>	<ul style="list-style-type: none"> <li>• difficulty circulating oxygen through the blood stream (methemoglobinaemia)</li> </ul>
<u>Levamisole</u> • medication to expel parasitic worms (anthelmintic)	<ul style="list-style-type: none"> <li>• unknown – may give a more intense high</li> </ul>	<ul style="list-style-type: none"> <li>• generally no longer used in human treatment, but still available as a veterinary medicine</li> <li>• highly toxic</li> </ul>	<ul style="list-style-type: none"> <li>• levamisole poisoning</li> <li>• fever</li> <li>• lowered white blood cell count (agranulocytosis)</li> </ul>

# 18. Adulterants in illicit drugs

## 18.2 Adulterants identified in particular illicit drugs (continued)

MDMA			
<u>Amphetamine, methamphetamine</u> • illicit stimulant drugs	<ul style="list-style-type: none"> <li>• have similar properties to the stimulant effects of MDMA/‘ecstasy’</li> <li>• amphetamine substances are often sold as, or in combination with, MDMA</li> </ul>	<ul style="list-style-type: none"> <li>• moderate doses can cause a range of adverse health effects</li> <li>• adverse effects from a large dose(s) are serious and may be life-threatening</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>
<u>PMMA, PMA</u> • synthetic drugs, chemically analogous to MDMA	<ul style="list-style-type: none"> <li>• unknown</li> <li>• potentially to improve apparent quality and increase weight</li> </ul>	<ul style="list-style-type: none"> <li>• lack of evidence on the health consequences, but suggestion that may be more toxic than MDMA</li> <li>• high doses have caused death</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>
Cannabis			
<u>Aluminium</u> • soft, malleable metal	<ul style="list-style-type: none"> <li>• unknown</li> <li>• aluminium contamination may result from impure water supply</li> </ul>	<ul style="list-style-type: none"> <li>• contribute to smoking related diseases</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>
<u>Glass</u>	<ul style="list-style-type: none"> <li>• unknown</li> <li>• potentially to improve apparent quality and increase weight</li> </ul>	<ul style="list-style-type: none"> <li>• health risks associated with the inhalation of hot glass fumes</li> </ul>	<ul style="list-style-type: none"> <li>• none reported</li> </ul>

# 19. Age-related factors

## 19.1 Age-related harm associated with substance use

CHILDREN AND ADOLESCENTS	OTHER ADULTS
<p><u>Harms associated with substance use at an early age</u></p> <ul style="list-style-type: none"> <li>onset of drug use in adolescent has been shown to be associated with an excess risk of drug dependence soon after onset of drug use, compared to onset in adulthood</li> </ul> <p><u>Harms associated with early use of specific substances</u></p> <p><b>Alcohol</b></p> <ul style="list-style-type: none"> <li>a significant proportion of deaths among young people are related to the acute consequences of alcohol consumption (e.g. road traffic accidents)</li> <li>use in early adolescence is a risk factor for drug use in later life</li> <li>heavy drinking during adolescence may affect normal brain functioning during adulthood</li> <li>early age of drinking onset is associated with an increased likelihood of developing alcohol abuse or dependence in adolescence and adulthood</li> </ul> <p><b>Tobacco</b></p> <ul style="list-style-type: none"> <li>early onset of smoking and drinking clearly linked to earlier onset and more regular use of illicit drugs</li> </ul> <p><b>Anabolic agents</b></p> <ul style="list-style-type: none"> <li>disruption of the normal pattern of growth and behavioural maturation in adolescence (e.g. stunting of height; virilization)</li> </ul> <p><u>Risk factors associated with substance use at an early age</u></p> <ul style="list-style-type: none"> <li>having a parent or other family members who uses psychoactive substances or alcohol – may be associated with problems in family functioning or the effects of maternal substance use during pregnancy on child development</li> <li>early school leaving, school truancy, poor school performance and expulsion or exclusion from school</li> <li>involvement in crime</li> <li>being in care</li> <li>psychological problems</li> </ul>	<p><b>Alcohol</b></p> <ul style="list-style-type: none"> <li>the majority of alcohol-related deaths occur among older age groups, mostly from liver disease and cancers</li> <li>evidence suggests that older adults are at a relatively high risk of experiencing drinking problems</li> <li>metabolic and physiological changes associated with ageing may lead to harmful effects at lower levels of consumption than for younger drinkers; may aggravate existing medical problems</li> <li>risks of interaction between alcohol use and prescription drugs and over-the-counter products</li> </ul> <p><b>Prescription drugs and OTC products</b></p> <ul style="list-style-type: none"> <li>frequent users of prescription drugs and OTC products</li> <li>older women are more likely to be prescribed, and to misuse, psychoactive medications than men</li> <li>older women are at a higher risk of prescription drug misuse compared to any other age group</li> <li>misuse may be intentional or unintentional</li> </ul> <p><b>Illicit drugs</b></p> <ul style="list-style-type: none"> <li>prevalence of illicit drug use is increasing among older age groups as current cohorts of drug users age</li> <li>little is known about the longer term effects of recreational drug use</li> </ul>

## 20. Gender-related factors

### 20.1 Gender-specific harms associated with substance use

ACROSS LICIT AND ILLICIT SUBSTANCES	LICIT SUBSTANCES	ILLICIT SUBSTANCES
<ul style="list-style-type: none"> <li>• in general, drug use is considerably more common among men than women</li> <li>• women generally report shorter progressions from first drug use to dependence than men</li> <li>• women appear to be more sensitive to the adverse effects of drugs than men</li> <li>• older women are at a higher risk of prescription drug misuse compared to any other age group</li> <li>• women with drug problems may suffer disproportionately from a range of problems and experience particularly high levels of mental health problems</li> </ul>	<p><b>Alcohol</b></p> <ul style="list-style-type: none"> <li>• women are more sensitive to the physiological effects of alcohol than men – achieve higher blood concentrations, report feeling more intoxicated and show higher vulnerability to alcohol dependence</li> <li>• women may have a greater sensitivity to the neurotoxic effects of alcohol</li> </ul> <p><b>Tobacco</b></p> <ul style="list-style-type: none"> <li>• women are more likely than men to develop a dependence on nicotine</li> <li>• women report shorter intervals between cigarettes, and find it more difficult to quit tobacco smoking than men</li> </ul>	<p><b>Amphetamines and cocaine</b></p> <ul style="list-style-type: none"> <li>• women may have a faster progression to dependence than men</li> <li>• some differences in the use and effects of cocaine have been reported between men and women; evidence is limited</li> </ul> <p><b>MDMA</b></p> <ul style="list-style-type: none"> <li>• women are more likely than men to experience low sodium levels in the blood caused by excessive ingestion of water (hyponatraemia)</li> <li>• physical and/or psychological adverse effects may be more frequent among women than men (similar effects with cocaine)</li> <li>• men may experience greater acute physiological effects (e.g. effects on blood pressure, heart rate and body temperature) compared with females</li> </ul> <p><b>Cannabis</b></p> <ul style="list-style-type: none"> <li>• compared to men, women may experience quicker progression to cannabis dependence and treatment entry</li> </ul> <p><b>Opioids</b></p> <ul style="list-style-type: none"> <li>• some studies of heroin users indicate that women tend to escalate their use of heroin more rapidly, become addicted in a shorter period of time, and seek treatment earlier than men do</li> <li>• excess mortality among female opioid users in comparison with the general female population is higher than the corresponding figure for males</li> </ul>

# 20. Gender-related factors

## 20.2 Complications and harms associated with substance use in pregnancy

LICIT DRUGS	ILLICIT DRUGS
<p><b>Alcohol</b></p> <ul style="list-style-type: none"> <li>• spontaneous abortion</li> <li>• still birth</li> <li>• preterm delivery and decrease in length of gestation</li> <li>• decreased foetal growth and birth weight</li> <li>• Fetal Alcohol Spectrum Disorder</li> </ul> <p><b>Tobacco</b></p> <ul style="list-style-type: none"> <li>• marginally increased risk for spontaneous abortion</li> <li>• contributes to a condition where the placenta remains in the lower portion of the uterus in later stages of pregnancy (placenta praevia) and placental abruption</li> <li>• low birth weight</li> <li>• premature birth</li> <li>• perinatal mortality is increased as a result of these effects</li> </ul> <p><b>Licit opioids</b></p> <ul style="list-style-type: none"> <li>• animal studies have shown adverse effects of tramadol on the foetus</li> </ul>	<p><b>Cannabis</b></p> <ul style="list-style-type: none"> <li>• like tobacco, cannabis use in pregnancy may be harmful to foetal development; studies show a consistent association between cannabis use in pregnancy and reduced birth weight – though less so than as a result of tobacco smoking during pregnancy</li> <li>• some reports that children born to women who have used cannabis in pregnancy may face mild developmental problems; however, the evidence is mixed and confounded by the other situational, health and lifestyle factors and polysubstance use in this population e.g. cannabis users are more likely to use tobacco, alcohol and other illicit drugs during pregnancy</li> </ul> <p><b>Cocaine</b></p> <ul style="list-style-type: none"> <li>• premature rupture of the membranes and placental abruption associated with cocaine use in pregnancy</li> <li>• other adverse effects attributed to cocaine may be caused by the other confounding situational, health and lifestyle factors and polysubstance use in this population</li> </ul> <p><b>Amphetamines</b></p> <ul style="list-style-type: none"> <li>• use in pregnancy has been associated with low birth weight, prematurity and increased foetal morbidity – confounded by the other situational, health and lifestyle factors and polydrug use in this population</li> </ul> <p><b>Anabolic agents</b></p> <ul style="list-style-type: none"> <li>• anabolic-androgenic steroids are teratogenic – use of these and other anabolic agents are contraindicated in pregnancy</li> </ul> <p><b>Illicit opioids</b></p> <ul style="list-style-type: none"> <li>• intrauterine growth of the foetus may be inhibited</li> <li>• newborns exposed to illicit opioids may have low birth weight compared to non-exposed children, be born prematurely, and experience respiratory depression and withdrawal symptoms – these symptoms may contribute to the increased risk of perinatal mortality associated with use of illicit opioids in pregnancy</li> <li>• evidence for a direct effect of illicit opioids is confounded by other situational, health and lifestyle factors (e.g. use of other drugs, mother's nutritional status, lifestyle, infections and exposure to trauma) are at least as decisive for the outcome of the pregnancy</li> <li>• problems with neurological developments may also arise as a consequence of a deprived social environment</li> </ul> <p><b>Plants</b></p> <ul style="list-style-type: none"> <li>• limited evidence suggests that khat chewing during pregnancy may have an impact on foetal growth and development; low mean birth weights have been reported in some studies</li> <li>• no published evidence that khat causes teratogenic effects in humans</li> </ul> <p><b>Volatile substances</b></p> <ul style="list-style-type: none"> <li>• use during pregnancy may increase the risk of adverse outcomes</li> <li>• suggestion that use may be associated with a neonatal withdrawal syndrome</li> </ul>

# 21. Route of administration

## 21.1 Harms associated with injecting drug use

INFECTIOUS COMPLICATIONS	EMBOLI, BLOOD VESSEL OCCLUSION AND THROMBOSIS	OTHER HARMS	SUBSTANCE-SPECIFIC HARMS
<p><u>Systemic infections</u></p> <ul style="list-style-type: none"> <li>• Viral infections</li> <li>• HIV</li> <li>• hepatitis B</li> <li>• hepatitis C</li> </ul> <p><u>Bacterial and fungal infections</u></p> <ul style="list-style-type: none"> <li>• bacteria in the bloodstream (bacterial septicaemia)</li> <li>• infection of the heart valves and/or endocardium (endocarditis)</li> <li>• inflammation of a joint (septic arthritis)</li> <li>• infection of the bones (osteomyelitis)</li> </ul> <p><u>Skin and injection site infections</u></p> <p>Common presentations:</p> <ul style="list-style-type: none"> <li>• collection of pus with associated swelling and inflammation (abscesses)</li> <li>• skin infection caused by bacteria (cellulitis)</li> </ul> <p>More severe local infections may include:</p> <ul style="list-style-type: none"> <li>• cervical abscesses</li> <li>• advanced soft tissue infection (necrotising fasciitis)</li> <li>• bacterial infections causing death of muscle tissue (myonecrosis)</li> <li>• infected ulcers as a consequence of impaired blood flow</li> </ul> <p><u>Bacterial and fungal infections</u></p> <ul style="list-style-type: none"> <li>• <i>staphylococcus aureus</i> is the most commonly identified cause of skin infections</li> <li>• serious harms including life-threatening soft tissue infection and death have resulted from outbreaks of infection with <i>clostridium novyi</i>, other <i>clostridium</i> species (including <i>clostridium botulinum</i>) and <i>bacillus anthracis</i></li> <li>• use of lemon juice to prepare heroin for injection has been implicated as the cause of outbreaks of fungal infections related to the <i>Candida</i> species, including serious eye infections (endophthalmitis)</li> </ul> <p>Increased risk of infection arises from:</p> <ul style="list-style-type: none"> <li>• injecting in areas of skin with high populations of commensal bacteria</li> <li>• subcutaneous and intramuscular injections</li> </ul>	<p>Impurities and non-soluble excipients may become microemboli in blood causing:</p> <ul style="list-style-type: none"> <li>• small clumps of dead cells to form (granulomas) in the lung leading to breathing difficulties (dyspnoea), lack of oxygen (hypoxia), pulmonary hypertension or emphysema</li> <li>• damage to the retina – cases associated with the injection of methylphenidate have been described</li> </ul> <p>Certain risk factors increase the chance of venous blockage:</p> <ul style="list-style-type: none"> <li>• inflammation of the vein (phlebitis)</li> <li>• injecting into the groin</li> <li>• lack of exercise</li> <li>• smoking</li> <li>• taking oral contraceptives</li> </ul>	<p><u>Overdose risk</u></p> <ul style="list-style-type: none"> <li>• injecting drug use poses particular risks for overdose</li> <li>• allows for the almost instant absorption of large quantities of the drug from the bloodstream</li> </ul> <p><u>Irritant effects</u></p> <ul style="list-style-type: none"> <li>• irritant reactions at injecting sites (e.g. phlebitis) can be attributed to: <ul style="list-style-type: none"> <li>– some drugs e.g. temazepam – may directly cause abscesses, tissue necrosis, venous fibrosis, inflammation of veins (phlebitis)</li> <li>– adulterants e.g. quinine</li> <li>– poor injection technique</li> <li>– acidic substances used to aid dilution</li> <li>– more likely to occur with subcutaneous injection or via the accidental administration of drugs to the surrounding tissues on intravenous injection (extravasation)</li> </ul> </li> </ul> <p><u>Intra-arterial injection irritant substances or those containing solid particles</u></p> <ul style="list-style-type: none"> <li>• swelling distal to the injection site</li> <li>• pain</li> <li>• discolouration</li> <li>• sensory and/or motor deficit</li> </ul> <p><u>Air embolus</u></p> <ul style="list-style-type: none"> <li>• potential hazard associated with the intravenous injection of large volumes of drugs</li> </ul>	<p><u>Anabolic agents</u></p> <ul style="list-style-type: none"> <li>• intramuscular injection may result in damage to the injection site and surrounding structures</li> </ul> <p><u>Cocaine</u></p> <ul style="list-style-type: none"> <li>• has local anaesthetic properties which may mask the pain of impending damage</li> <li>• effects of cocaine by injection are relatively brief and therefore users may inject frequently increasing likelihood of sharing and blood borne virus exposure</li> </ul> <p><u>Crack cocaine</u></p> <ul style="list-style-type: none"> <li>• is not soluble without the addition of a weak acid (e.g. citric acid)</li> <li>• increased risk of infection associated with the use of lemon juice as an acidifier</li> <li>• increased risk of tissue damage and possibly anaerobic infections is associated with the excess use of acidifiers</li> </ul> <p><u>Prescription drugs</u></p> <ul style="list-style-type: none"> <li>• injecting complications related to insoluble excipients in tablets; including blockage of blood vessels, formation of blood clots, and arterial inflammation</li> </ul>

# 21. Route of administration

## 21.2 Harms associated with drug use orally, intranasally or by inhalation

ORAL USE (SWALLOWING)	INTRANASAL USE (SNORTING)	INHALATION USE (INHALATION/SMOKING)	SUBSTANCE-SPECIFIC HARMS
<ul style="list-style-type: none"> <li>oral route may be preferred for convenience (e.g. MDMA, LSD and alcohol)</li> <li>nearly all drugs can be taken orally, but many drugs are absorbed unpredictably via this route</li> <li>tends to be the route least associated with harmful consequences as psychoactive effects can take longer to develop and/or may be less intense</li> </ul>	<ul style="list-style-type: none"> <li>impaired breathing</li> <li>minor nosebleeds</li> <li>irritation and possible perforation of nasal septum</li> <li>ulceration of nasal mucosa</li> <li>vasoconstriction of mucous membranes and subsequent vasodilation sometimes causing chronic inflammation of the mucous membrane of the nose (rhinitis)</li> <li>dental erosion if substance is snorted through the nose and then enters the mouth; associated with cocaine and methamphetamine use</li> </ul>	<p><u>Inhalation</u></p> <ul style="list-style-type: none"> <li>irritation and rash around nose and mouth from directly inhaled substances</li> </ul> <p><u>Smoking</u></p> <ul style="list-style-type: none"> <li>respiratory complaints e.g. coughing, wheezing, chest pain, black sputum, lung damage</li> <li>may exacerbate existing respiratory illnesses such as asthma</li> <li>increased risk of respiratory cancers associated with tobacco use</li> </ul>	<p><u>Anabolic agents</u></p> <ul style="list-style-type: none"> <li>acute liver injury associated with use of 17<math>\alpha</math>-alkylated oral AAS</li> </ul> <p><u>Cocaine</u></p> <ul style="list-style-type: none"> <li>local anaesthetic effect resulting in difficulty swallowing</li> </ul> <p><u>Cannabis</u></p> <ul style="list-style-type: none"> <li>differences in the administration (i.e. compared to tobacco smoking) mean smoking cannabis may result in greater harm to the respiratory system</li> <li>oral consumption makes dosage difficult to regulate – unpleasant reactions more difficult to avoid</li> </ul> <p><u>Heroin</u></p> <ul style="list-style-type: none"> <li>rare reports of a disease of the white matter of the brain (leukoencephalopathy) associated with smoking heroin</li> </ul> <p><u>Volatile substances</u></p> <ul style="list-style-type: none"> <li>intense cooling in mouth/throat may cause laryngeal spasm blocking airways and causing subsequent death by asphyxiation</li> </ul>

## 22. Polysubstance use

### 22.1 Harms associated with the concurrent use of specific substances

	EFFECTS ASSOCIATED WITH CONCURRENT USE OF:	
	ALCOHOL	ILLICIT DRUGS
Amphetamines	<ul style="list-style-type: none"> <li>increases perceived total intoxication</li> <li>increases adverse cardiovascular effects</li> </ul>	<b>Cocaine</b> <ul style="list-style-type: none"> <li>limited evidence; may have adverse consequences on the central nervous system</li> </ul>
MDMA and related analogues	<ul style="list-style-type: none"> <li>reduces subjective sedation associated with alcohol, but not alcohol-induced impairments</li> <li>increase in plasma levels of MDMA</li> <li>decrease in blood alcohol levels</li> <li>may enhance the temporary impairment of immune cells associated with MDMA use (transient immune dysfunction)</li> </ul>	<b>Cannabis</b> <ul style="list-style-type: none"> <li>users may potentially experience cumulative CNS impairment</li> <li>may increase susceptibility to infection</li> </ul> <b>Cocaine</b> <ul style="list-style-type: none"> <li>evidence from animal studies suggests an increased risk of neurotoxicity</li> </ul>
Anabolic agents	<ul style="list-style-type: none"> <li>none documented</li> </ul>	<b>Cocaine</b> <ul style="list-style-type: none"> <li>potential for clenbuterol and AAS to exacerbate the adverse cardiovascular effects of cocaine</li> </ul>
Cannabis	<ul style="list-style-type: none"> <li>reduction in driving performance</li> </ul>	
Cocaine	<ul style="list-style-type: none"> <li>increases blood levels of cocaine and the active metabolite cocaethylene; users may perceive a more intense feeling of intoxication</li> <li>users may perceive a reduction in the sedating effects of alcohol</li> <li>combination potentially increases adverse cardiovascular effects</li> <li>patients with coronary artery disease or alcohol dependence may be particularly vulnerable to the combined toxic effects of alcohol and cocaine</li> </ul>	<b>Ketamine</b> <ul style="list-style-type: none"> <li>potential to exacerbate the cardiovascular risks of cocaine (crack)</li> </ul> <b>Methadone</b> <ul style="list-style-type: none"> <li>increases adverse cardiovascular effects (e.g. increased blood pressure and heart rate)</li> </ul>
GHB	<ul style="list-style-type: none"> <li>increases the risk of respiratory depression</li> </ul>	<ul style="list-style-type: none"> <li>none documented</li> </ul>
Nitrites	<ul style="list-style-type: none"> <li>none documented</li> </ul>	<b>Misuse of drugs for treating erectile dysfunction (e.g. viagra)</b> <ul style="list-style-type: none"> <li>increases the hypotensive effects (abnormally low blood pressure)</li> </ul>
Opioids	<ul style="list-style-type: none"> <li>increases the depressant effects of alcohol on the central nervous system; can be fatal</li> <li>acute use of alcohol and methadone appears to result in lower blood-alcohol levels – clinical significance unclear</li> </ul>	<b>Benzodiazepines</b> <ul style="list-style-type: none"> <li>increase the depressant effects of opioids on the central nervous system</li> </ul>
Prescription drug misuse	<b>Benzodiazepines</b> <ul style="list-style-type: none"> <li>increase the depressant effects of alcohol on the central nervous system</li> <li>diazepam increases plasma levels of alcohol</li> <li>may increase aggression and/or amnesia</li> <li>may reduce the anxiety reducing (anxiolytic) effects of benzodiazepines</li> </ul> <b>CNS stimulants</b> <ul style="list-style-type: none"> <li>increases methylphenidate levels and exacerbates effects on the central nervous system</li> </ul>
