Maternity guideline for the care of women who have been affected by Female Genital Mutilation

Page 1 of 17
Introduction:

These guidelines have been produced to support the policy of asking all women at their booking appointment whether they have experienced any form of surgery to their genitals including female genital mutilation.

The World Health Organisation (WHO) defines female genital mutilation as: “all procedures that involve partial or total removal of the external female genitalia, or other injury to the female genital organs for non-medical reasons – WHO 2010

FGM is a form of violence against women and girls and is an abuse of human rights.

It is sometimes inappropriately referred to as Female Circumcision or Female Genital Cutting. Some communities use local names for this practice, including the term “sunna”. FGM is not a requirement of any religion.

The WHO classification of FGM breaks it down into four types:

Type I: Partial or total removal of the clitoris and/ or the prepuce (clitoridectomy).

Type II: Partial or total removal of the clitoris and labia minora, with or without excision of the labia majora.

Type III: (Infibulation). Narrowing of the vaginal orifice with creation of a covering seal by cutting and appositioning the labia minora and/ or labia majora, with or without excision of the clitoris.

Type IV: All other harmful procedures to the female genitalia for non-medical purposes, e.g. pricking, piercing, incising, scraping and cauterising. (NB. the legal status of piercing is unclear in the UK)

Ninety percent are either Type I, II or IV, while Type III (infibulation) is only found in 10% of known cases.

The single most important risk factor determining whether a woman undergoes a ritual procedure is her country of origin. Any woman who comes from an FGM practicing country falls within the at risk group, especially if the prevalence is high e.g. Somalia, Egypt, Sudan.

FGM is practised mainly in Africa (about 30 countries) - the majority of women from Somalia, Sudan, Ethiopia and Sierra Leone will have had some form of FGM, but it is also practised, though to a lesser extent, in the Middle East, India and Indonesia. The global incidence is 130 million with 2 million experiencing a procedure annually.
The law and FGM:
The Female Genital Mutilation Act 2003 made it illegal for UK residents (in England and Wales) and permanent residents to practice FGM within or outside in the UK (there is different legislation for Scotland). The act made also made it illegal for someone to take a British Citizen aboard to perform the operation whether or not it is against the law in that country. It is also illegal to assist in carrying out FGM abroad. The law however appears to allow surgery to the external genitalia for comfort, sexual confidence, body image and self esteem (eg. labial reduction surgery).

Antenatal Period, booking appointment and FGM enquiry:

All clinical staff should be aware of a nominated obstetrician (link-person) in the trust or community with whom cases may be discussed or referred. At BHRUT Ms Maclaverty is the nominated obstetrician. Advice can also be sought from the consultant midwife (public health).

Hospitals and clinics in the UK offering specialist FGM services can be found on the FORWARD internet website at: www.forwarduk.org.uk/resources/support/well-woman-clinics

It is BHRUT maternity guidance that sensitive enquiry at the booking appointment should be made to determine the FGM status of all women.

In addition, it is essential to classify the type and severity of FGM as this will influence maternity and obstetric care. Twenty thousand girls in the UK are also at risk therefore child safeguarding advice should be sought for all daughters thought to be at risk (see page 8 for details on safeguarding responsibilities regarding FGM).

All women should be asked sensitively about FGM at booking and the E3 pathway should be followed. See appendix 2 for the FGM E3 pathway.

Factors to remember for the booking appointment:

- Must be in private – follow the time to talk procedure whereby the first part of the booking is undertaken with the woman on her own
- Follow the E3 FGM pathway questions
- Where a woman has a hearing impairment, or her first language is not English, arrangements should be made for an interpreter to be present. Wherever possible it should be ascertained from the woman whether the interpreter is suitable. Family members and friends should never be used to interpret interviews of this kind. Download face to face booking form from Intr@net (under further categories), complete and email to #interpreting bookings. The three way phone may be used in circumstances where the language needs of the woman have not been recognised prior to the AN appointment or in an emergency.
If FGM is identified:

- Use a diagram or medical photography (with consent). This aids communication with the patient and other clinicians, and limits repetitive examinations.
- Classify the type of FGM using a preformatted sheet with predrawn diagram (Appendix I).
- Include a psychological assessment and referral to a psychologist (via perinatal mental health team) if deemed necessary and agreed upon by the woman.

Following the assessment, if a woman is a primigravida with type III FGM or it is felt that vaginal examination or delivery will be difficult or impossible she should be referred to Ms Maclaverty’s antenatal clinic for consideration for antenatal deinfibulation while remaining under the care of her original midwife or obstetrician.

Antenatal deinfibulation should be offered if vaginal access is inadequate, and to all women with type III FGM. It should ideally be performed around 20 weeks gestation (reduces risk of miscarriage and allows time for healing before birth).

Benefits of antennal deinfibulation:

- Avoids the need to cut scar tissue in labour.
- Reduces excessive laceration.
- Reduces the risk of fetal asphyxia due to delayed crowning at the point of delivery.
- Reduces the incidence of bacterial vaginosis and associated preterm labour.

Procedure for antenatal deinfibulation:

- Pre-op: MSU, Group & Save.
- Setting: Minor-op Out-Patient Room or Operating Theatre.
- The professional undertaking the deinfibulation must have experience.
- Ensure adequate analgesia (pre & post-op):
  - usually local/regional.
  - consider psychological needs (G.A. may rarely be indicated).
- Use a blade or scissors for the procedure.
• The incision should be made along the vulval excision scar until reaching the point where the urethral meatus is clearly visualised

• Closure of the newly opened edges should be brought together with fine absorbable material (Vicryl Rapide) to reduce the likelihood of infection and bleeding and to keep the opposed edges separated

• Women should be advised that the flow of urine will change as they will pass urine much quicker and with greater volume. A perceived ‘lack of control’ when emptying the bladder is common

• Women should drink plenty of water after the procedure to help dilute the urine and reduce stinging sensation to the area. They should not use soap or detergent (only plain water) to keep the area clean for the first 3-4 days following the procedure

• Consider prophylactic antibiotics

• Antenatal care continues as for any other woman

**Intrapartum deinfibulation** (offered if vaginal access is adequate)

Some women would prefer to have the procedure performed during labour (so as to experience only one lot of pain and trauma). This may be normal practice in their country of origin. Counselling by specialist FGM services may be necessary.

**Intrapartum care**

<table>
<thead>
<tr>
<th>Potential maternal consequences of FGM:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fear of childbirth</td>
</tr>
<tr>
<td>Increased likelihood of caesarean section</td>
</tr>
<tr>
<td>Increased likelihood of postpartum haemorrhage</td>
</tr>
<tr>
<td>Increased likelihood of episiotomy</td>

<tr>
<td>Increased likelihood of severe vaginal lacerations (including fistula formation)</td>
</tr>
<tr>
<td>Extended hospital stay</td>
</tr>
<tr>
<td>Difficulty performing vaginal examinations in labour</td>
</tr>
<tr>
<td>Difficulty in applying fetal scalp electrode</td>
</tr>
<tr>
<td>Difficulty in performing fetal blood sampling</td>
</tr>
<tr>
<td>Difficulty in catheterisation of the bladder</td>
</tr>
</tbody>
</table>

1. When defibulation has been performed antenatally:

• Aim for vaginal birth

• Aim for intact perineum

• Episiotomy is recommended if inelastic scar tissue prevents progress

• Episiotomy when indicated should be medio-lateral
2. When no antenatal deinfibulation (unbooked or elected for intrapartum defibulation):

- Birth should be in a unit with immediate access to facilities for emergency obstetric care
- The Labour Ward Coordinator must be informed. The woman should be allocated a Senior Midwife
- Aim for vaginal birth
- Place IV Access; send FBC and Group & Save (risk of PPH)
- Provide adequate analgesia to prevent flashbacks to original procedure
- Inform Registrar (who is experienced at deinfibulation) or Consultant Obstetrician (if the Registrar does not have experience)
- Epidural should be offered, adequate pain relief is essential as vaginal examinations are poorly tolerated, for anterior episiotomy and deinfibulation, and to psychologically reduce flashbacks
- Perform deinfibulation in the first or second stage of labour
- Informed consent is essential prior to deinfibulation is essential
- Infiltrate with local anaesthetic
- Perform an anterior midline incision to expose the urethra and clitoris that are beneath the scar tissue. (If uncertain, stop when the urethral meatus is visible)
- In the 2nd stage of labour perform the incision at the time of the fetal head crowning
- Stretching the fused labia allows a good view of the fusion line and minimizes blood loss
- Care must be taken to protect the fetal head from laceration

WHO recommends suturing raw edges to prevent re-infibulation

It is illegal to re-infibulate
Postnatal Care:

- Routine care
- Debrief if deinfibulation was carried out during labour
- Discuss with woman legal status of FGM in the UK (especially if baby girl or girls in the family)
- Inform Health Visitor
- Inform woman of the link between FGM, pain and health problems in later life
- If deinfibulation was carried out in labour, 4-6 week postnatal follow up recommended to assess healing (GP or hospital appointment)
- If deinfibulation was carried out in labour, advise to avoid sexual intercourse until healing has occurred and to use lubrication if necessary
- Advice / counselling may be required in relation to passing urine, menstruation, sexual health needs
- Discuss contraception, IUCD will be a method not previously available
- Cervical smear uptake should also be discussed

Safeguarding girls and FGM:

You have a statutory responsibility to safeguard girls from being abused through FGM.

FGM education information (orange FGM: the facts leaflet)
www.fco.gov.uk/resources/en/pdf/travel-living-abroad/when-things-go-wrong/fgm-leaflet-100310 should be provided to all women identified as having some form of FGM through the booking appointment. The legal and safeguarding implications should be sensitively explained to women as part of the booking appointment.

If you have any safeguarding concerns regarding FGM seek advice from the safeguarding midwife, consult and follow the relevant safeguarding procedures (below) and speak with your manager.

Appendix 2 - FGM E3 Pathway

E3 Flow Chart for Female Genital Mutilation

On Personal History in E3 this question will be asked immediately after the Medical History question.

Have you ever had any surgery to your genitals such as: (genital piercings, operations or have you been cut or circumcised)?

Yes

No

Irrespective of the answer to the previous question E3 will then ask the question: Have you ever been circumcised, closed or cut down there?

No

Yes

E3 will continue to ask the general booking questions

Have you been opened before?
- Yes (text box for comments)
- No

Do you ever have any problems passing urine or staying dry at night?
- Yes (optional text box)
- No

How long does it take? How long have you experienced these problems for?
Answer is a text box for the comment
Appendix 3 - FGM Quick Reference Guide

Identify women with FGM/C at booking appointment. Question all women identified as at risk.

- FGM/C Identified – Give leaflet
- No FGM/C – no further action. Document in notes

Type III Infibulation identified or extensive Type II (or unsure).
Refer to Ms Macclaverty’s ANC for physical examination (12 – 15/40 weeks)
Complete Audit/Plan (appendix 1)

Type I or II Infibulation identified – no further action.
Complete Audit/Plan (appendix 1)

De-Infibulation offered and woman informed of legal implications of FGM in the UK

- De-infibulation accepted.
  Booked onto Gynae theatre list (before 20/40 if possible)
  Follow up appointment in ANC x1 week after procedure.

- De-Infibulation declined antenatally
  Reversal recommended in 1st/2nd stage labour.
  Group & save/cannulate.

Routine follow up appointment offered postnatally.
Refer to Ms Macclaverty if concerns re: healing.
Health visitor and GP informed.
Woman informed again of legal implications of FGM in the UK.
