# Removal of sustainable placement at Hunt's Green Farm (AP2)

---

- A significant quantity of excavated material arises between the Chilterns Tunnel north portal and the Wendover Dean viaduct from the construction of the South Heath Green Tunnel and associated cuttings.
- A sustainable placement site was identified to avoid significant lorry movements in removing this material.
- The sustainable placement site has been the source of significant local objection and the need for permanent placement has been reviewed.
- It is now proposed to remove the excavated material from this area along the trace to a road head on Rocky Lane. The material will then be transported by road via the A413 to be used further north on the route, or disposed of off site.
- Temporary stockpiling of material to regulate movement onto the road will still occur at Hunt's Green Farm, but the only permanent placement of materials will be to create a new landscape bund along the line of route to mitigate noise and visual effects.
