Ebola virus disease outbreak in West Africa (December 2013 to present)

Situation update

- since the last report on 4 December 2015, there have been no confirmed cases of Ebola virus disease (EVD) reported in West Africa

- **Liberia** has reported no confirmed cases for six consecutive weeks. The most recent cluster of cases in Liberia was determined to be the result of the re-emergence of Ebola virus that had persisted in a previously infected individual. The last two reported cases in the country were discharged from hospital on 3 December 2015, following two consecutive negative EVD tests. If no further cases are reported, the country will be declared free of human-to-human transmission on 14 January 2016, and the country will then enter a 90-day period of enhanced surveillance

- **Guinea** was declared free of human-to-human transmission on 29 December 2015 after the completion of 42 days without cases since the last person confirmed to have EVD tested negative for Ebola virus RNA for the second time. Guinea has now entered a 90-day period of enhanced surveillance

- **Sierra Leone** was declared free of human-to-human transmission on 7 November 2015. The country remains within a 90-day period of enhanced surveillance which is scheduled to conclude on 5 February 2016

- as of 03 January 2016, a total of 28,637 clinically compatible cases of EVD (15,249 confirmed) have been reported associated with the West African outbreak, 11,315 of which have died
Countries reporting or have previously reported transmission

To date, a total of ten countries have reported EVD cases associated with this outbreak (Guinea, Liberia, Sierra Leone, Mali, Nigeria, Senegal, Spain, the UK, the US and Italy). However, the vast majority of cases (28,601 CCC, 99.9%) have been reported from Guinea, Liberia and Sierra Leone (see Table 1).

Data subject to change.

¹Liberia has recorded three separate EVD outbreaks. The first (hatched cells) was declared over on 9 May 2015 following 42 days without a case, but two further localised outbreaks have occurred (data in plain cells). Outbreak two began on 29 June 2015 and was declared over on 3 September 2015 (6 confirmed cases, 2 deaths). The third outbreak began on 19 November 2015 with a total of 3 confirmed cases and one death reported to date.

*Outcomes for many cases are unknown

^ Data not available

* Not reported due to the high proportion of probable and suspected cases that are reclassified. Latest available data
