

Dear Sir

Very supportive of this activity.

There is no mention of the temperature of rocks at the depth of interest. Is this of no interest?

Given that the communities adjacent to existing nuclear facilities are much more likely to be receptive to plans for the GDF than elsewhere, is there additional more detailed information that could be gathered for these locations?

The illustrations imply a GDF location that is a greenfield. Given the requirement to reduce the risk of intrusion by future generations would it not be better to build beneath a populated site of outstanding historical importance where continuous records are more likely to be maintained?

Yours faithfully

Richard Garnsey
