Statistics
Pocketbook
2016**

Department for Environment, Food and Rural Affairs

Foreword	5
Summary	6
<u>Chapter 1: Food Chain</u>	
1.1: Economic summary of the UK food chain	7
1.2: Gross Value Added of the UK agri-food sector	9
1.3: Trends in the total factor productivity of the UK food sector	10
1.4: Agri-food sector employees, GB basis	11
1.5: UK food & drink manufacturing by product type	12
1.6: UK grocery market shares	13
1.7: UK Consumer expenditure on food, drink and catering	14
<u>Chapter 2: Prices and Expenditure</u>	
2.1: UK trend in food prices in real terms	15
2.2: Trend in share of spend going on food & drinks in low income & all UK households	16
2.3: Income decline after housing costs, low income decile (UK)	17
2.4: UK retail price changes by food group	18
2.5: Percentage change in food purchases, low income households (UK)	19
2.6: Factors influencing consumer product choice	20
2.7: UK trend in sales of ethical produce	21
<u>Chapter 3: Global and UK Supply</u>	
3.1: Origins of food consumed in the UK	22
3.2: UK Food production to supply ratio	23
3.3: Trends in UK food production	24
3.4: UK trade in different food groups	25
3.5: Trend in exports of food, feed and drink	26
3.6: World trends in population, energy requirement, energy supply and the prevalence of under-nourishment	27
3.7: World agricultural commodity prices	28
3.8: World grains stocks to consumption ratio	29
3.9: Retailer warehouse stock levels - 5 year change	30
<u>Chapter 4: Environment</u>	
4.1: Greenhouse gas (GHG) emissions from the UK agri-food sector	31
4.2: Trends in CO ₂ emissions from UK food and drink manufacturing	32
4.3: Food and drink sub-sectors represented within the FHC	33

Chapter 5: Waste

5.1: UK food and drink waste through the food chain	34
5.2: UK cost of avoidable food and drink waste per household per week, by food group	35
5.3: Management of food waste by subsector for the UK hospitality and food sector	36
5.4: Understanding out of home consumer food waste	37
5.5: Collection of food waste by local authorities in the UK	38
5.6: UK food & drink packaging waste in the supply to households	39
5.7: UK avoidable household food and drink waste by food group and reason for disposal	40
5.8: Food wasted at each stage of the supply chain in Europe and Russia	41

Chapter 6: Dietary Health

6.1: UK Trend in purchases of fruit & vegetables	42
6.2: Trend in the consumption of fruit & vegetables in men, women and children in England	43
6.3: UK Trends in intakes of fat, saturated fatty acids, non-milk extrinsic sugars & sodium	44
6.4: UK average micronutrient intakes	45
6.5: The UK household diet compared with the eating out diet	46
6.6: Trends in average energy intake from food & drink	47
6.7: UK dietary indicators by equivalised income	48
6.8: Levels of adult obesity in England	49
6.9 UK Regional household consumption of fruit and vegetables	50
6.10 UK Trend in average alcohol intake (including eating out)	51

Chapter 7: Safety and Confidence

7.1: UK inspections and enforcement actions of food businesses	52
7.2: Contamination incidents investigated in the UK by the FSA	53
7.3: Number of unsatisfactory analyses found in imported food	54
7.4: Factors that would make people trust food and drink companies/brands more	55
7.5: Percentage of people concerned about certain food issues	56
7.6: Percentage of people concerned about where food is produced	57
7.7: Methods used to assess whether food is safe to eat	58
7.8: Maximun time after use by date/best before date that respondents would eat/use food	59
7.9 Frequency of washing raw meat, fish and poultry	60

Glossary	61
-----------------	-----------

This publication provides a concise round-up of statistics on food covering the economic, social and environmental aspects of the food we eat. It contains statistics for different time periods, but always using latest available data at the time of release.

Data comes from surveys run by Defra and the Office for National Statistics and from a wide range of other sources including government departments, agencies and commercial organisations. Links to data sources are included on every page.

Associated datasets containing all charts and key data sources from this year's publication are also available.

Data are a mixture of National Statistics, Official Statistics and unofficial statistics. Unofficial statistics are used where there are gaps in the evidence base. National Statistics (Official Statistics that comply with the national statistics code of practice) are indicated using the logo pictured here.

Further information on National Statistics can be found on the UK Statistics Authority website.

The Agri-Food Chain

Agriculture

Manufacturing

Wholesaling

Retailing

Catering

£108bn

The agri-food sector contributed £108 billion, or 6.8% to national Gross Value Added in 2014

3.9m

People employed in the agri-food sector in Q1 2016, 13.5% of national employment.

£18.0bn

The value of food and drink exports in 2015. Beverages are the largest export category by far, at £6.3bn.

↓ 3.2%

Food prices fell by 3.2% in real terms in the last 12 months, following a 5 year period when food prices were rising faster than general inflation.

£201bn

Total consumer expenditure on food, drink and catering in 2015. On average, around 11% of all household spending is on food.

3.9

Purchases of 5 A DAY was 3.9 portions in 2014. Low income group households bought the least fruit and veg: 3.0 portions per person/day.

£470

The average UK household spend on food that could have been eaten but is thrown away is around £470 a year.

1,514

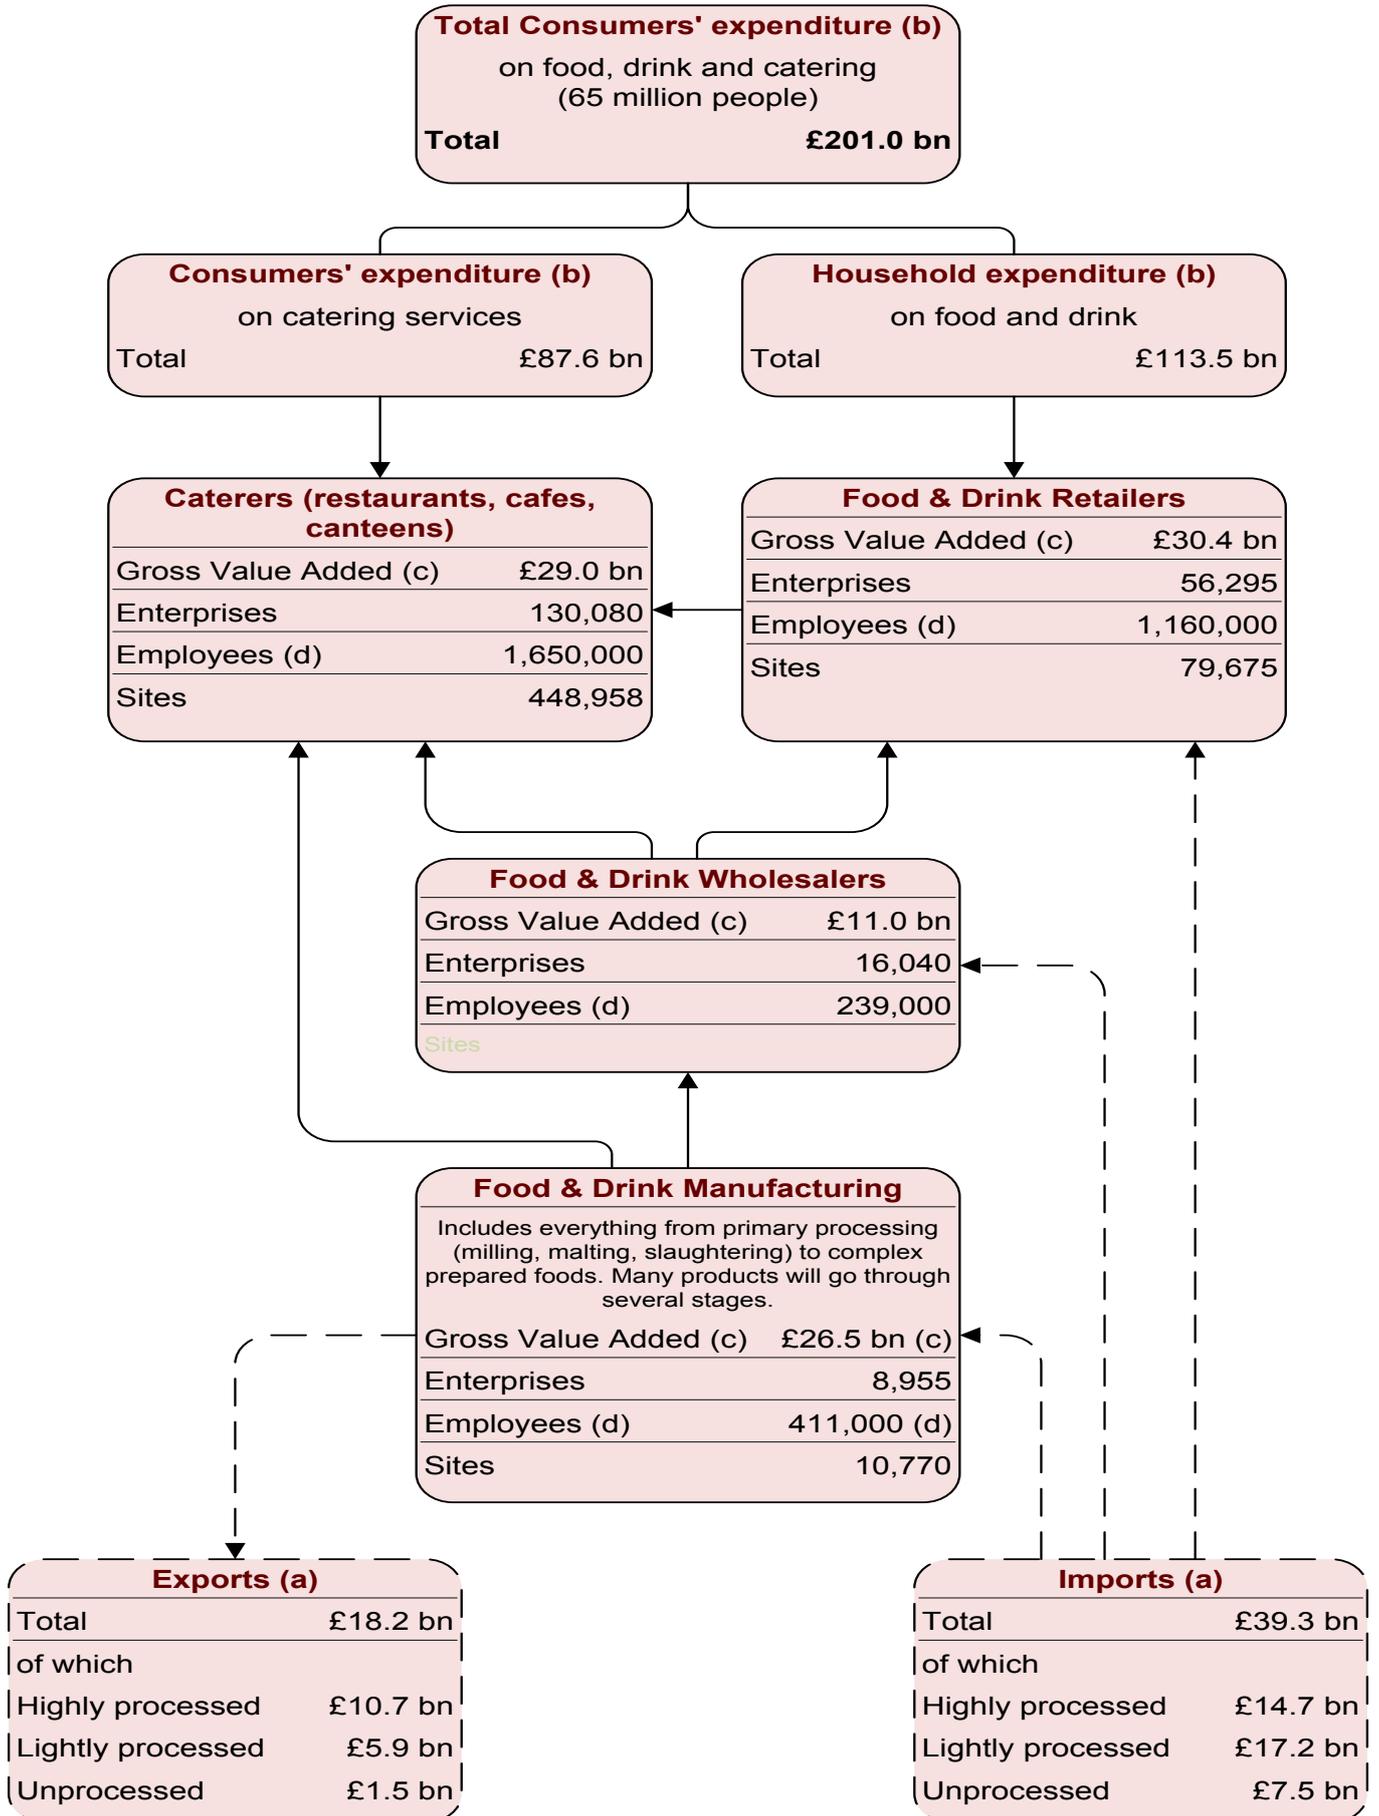

Food, feed and environmental contamination incidents investigated by the FSA in 2015.

70m

Emissions from the food chain in tonnes of CO₂ equivalent. Farming accounted for 56m.

1 Food Chain

1.1: Economic summary of the UK food chain beyond agriculture¹

(a) Overseas trade data is for final full year 2015 from HM Revenue and Customs, and is subject to amendment. (Data may not equal total due to rounding.) Dashed lines indicate main trade flows.

(b) Consumers' expenditure, properly known as household final consumption expenditure, is provisional from the Office for National Statistics for full year 2015 and is calculated at current prices. (Data may not equal total due to rounding.)

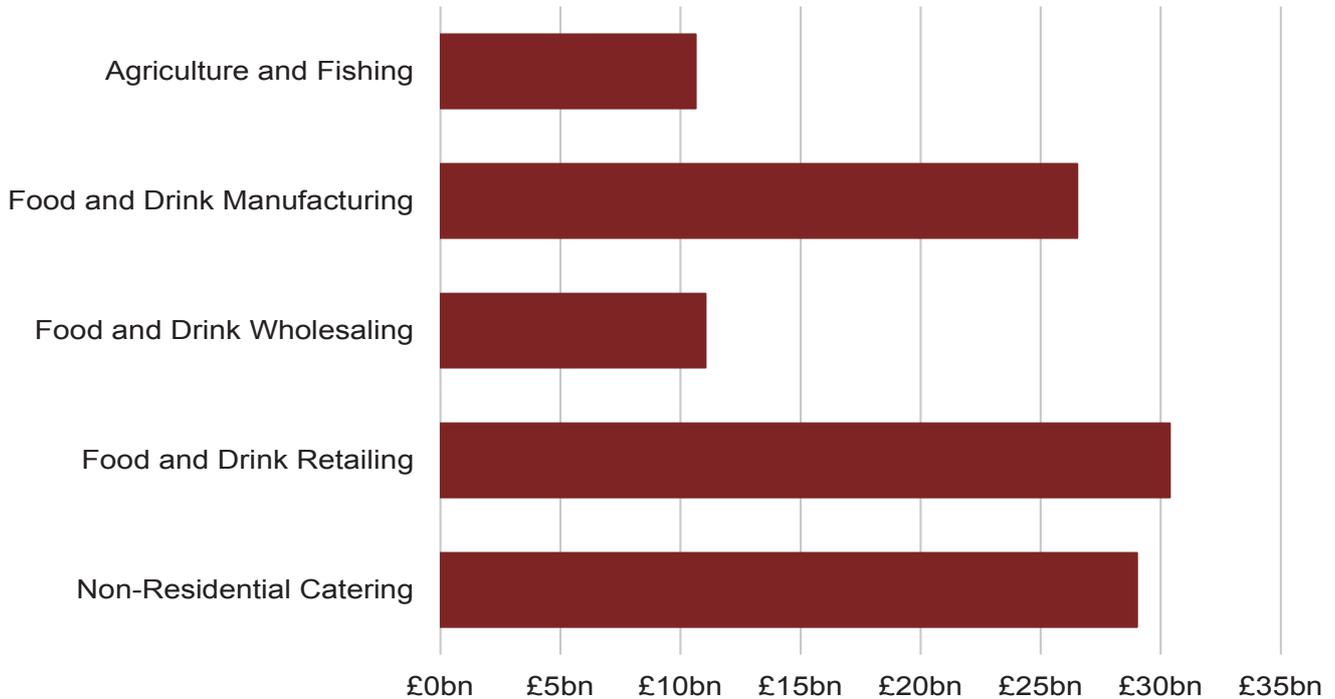

(c) Gross value added (GVA) is the difference between the value of goods and services produced, and the cost of raw materials and other inputs used up in production. GVA data is taken from the ONS's Annual Business Survey and is final data for full year 2014. It is calculated at basic prices (market prices less taxes plus subsidies).

(d) Agricultural wholesaling includes an estimate of employment of wholesalers of agricultural machinery from the Annual Business Survey. (Employee data is rounded.)

¹ Excludes sectors downstream from food and drink manufacturing such as the food and drink supply industry (food processing machinery).

1.2: Gross Value Added of the UK agri-food sector, 2014

The agri-food sector contributed £107.6 billion or 6.8% to national Gross Value Added in 2014.

The GVA of the food sector (excluding agriculture) increased 2.0% in 2014, following a 8.0% increase in 2013. Wholesaling GVA increased by 10.9%, catering by 7.4% and manufacturing by 1.1%. Retailing GVA decreased by 4.6%.

Longer term, the food sector (excluding agriculture) increased by 66% between 2000 and 2014 while the whole economy increased by 78%. The food sector has less scope for growth as there is a limit to consumer intake capacity and therefore it relies largely on quality improvements.

In 2014, there was a net increase of 1930 in the number of registered enterprises in the food sector.²

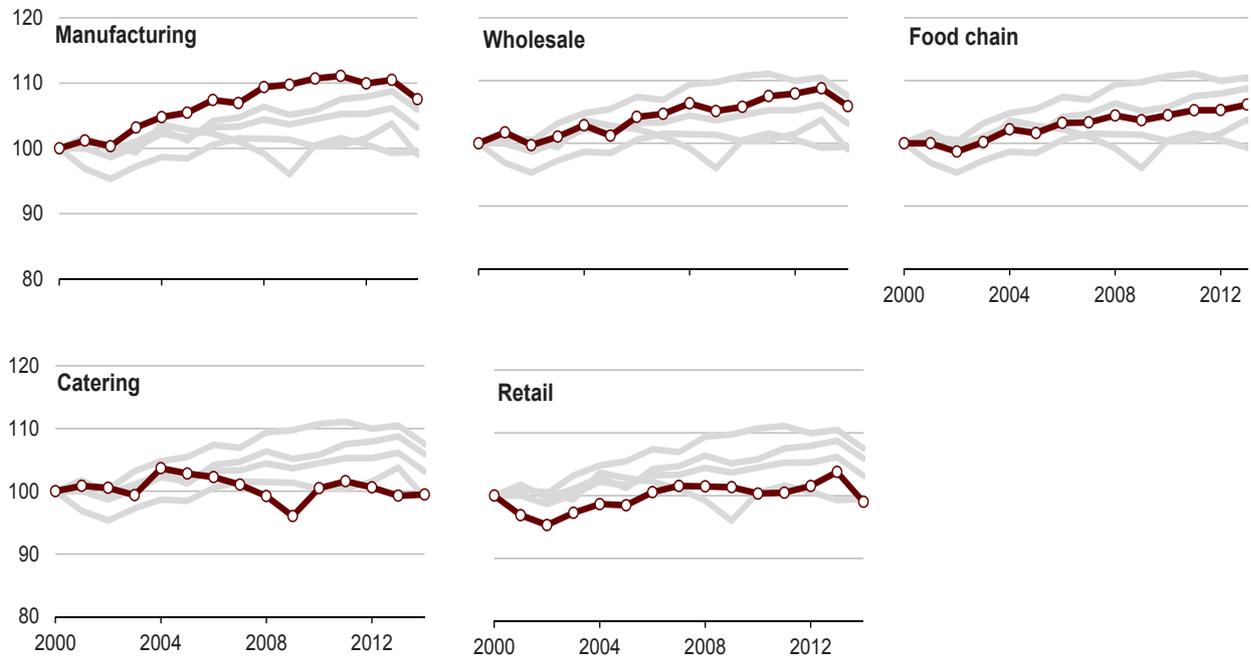

Source: *Annual Business Survey (ONS) & Agriculture in the United Kingdom (Defra)*

² Business Demography, Enterprise Births, Deaths and Survivals, ONS 2015

1.3: Trends in the total factor productivity³ of the UK food sector⁴

Total factor productivity of the UK food chain beyond the farmgate has decreased by 2.8% between 2013 and 2014. Productivity in the wider economy has increased in 2014 by 1.2%.

The TFP of the UK food sector is an indicator of the efficiency and competitiveness of the food industry within the UK. An increase in TFP indicates the industry is improving its competitiveness. Productivity in food retail saw a decrease in 2014 of 4.6%, although over the last 10 years it has increased by 0.1%. Productivity in food manufacturing saw a decrease in 2014 of 2.7%, although over the last 10 years the average annual growth was 0.3%.

The calculation is based on reliable data on business sales and costs, employment by industry and on price indices all collected by the Office for National Statistics.

Source: *Total Factor Productivity of the United Kingdom Food Chain 2000-2014*, Defra, July 2016.

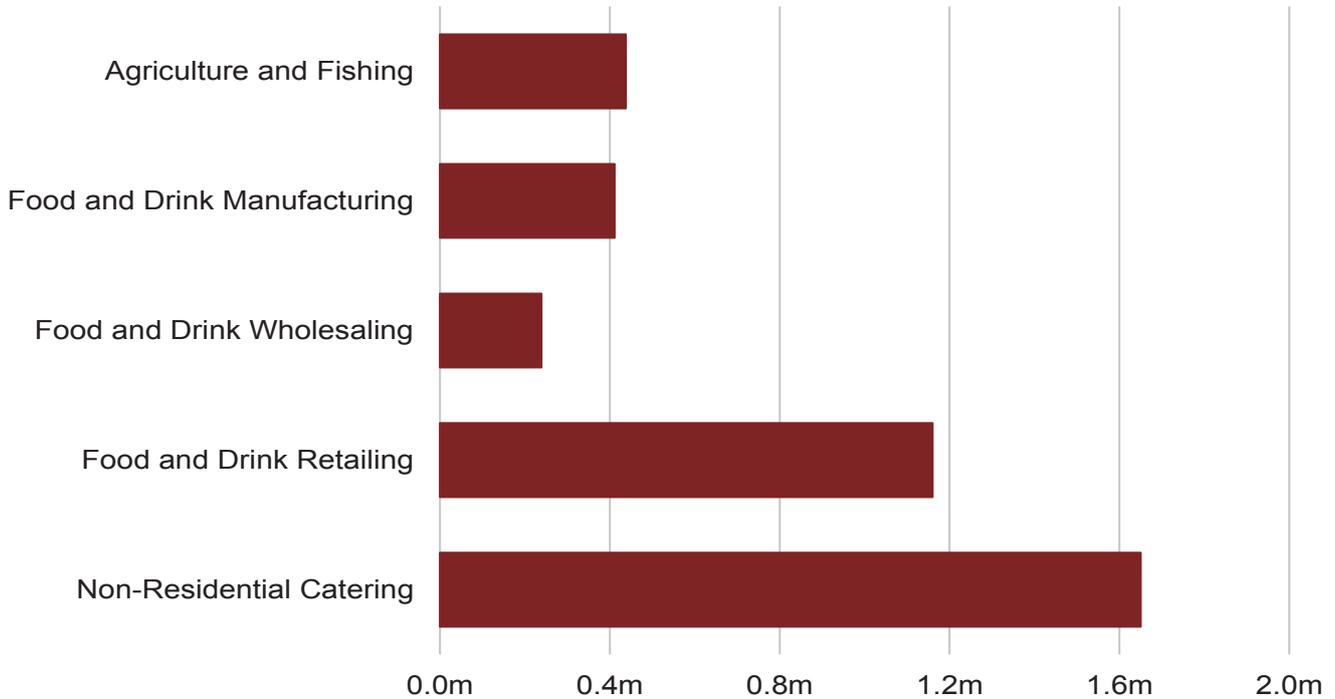

³ See Glossary for definition of Total Factor Productivity.

⁴ Wholesaling includes tobacco (SIC 46.35).

1.4: Agri-food sector employees (GB)⁵, Q1 2016

The food sector in GB employed 3.5 million people in Q1 2016 (3.9 million if agriculture and fishing are included along with self-employed farmers), a 2.6% increase on Q1 2016. It covered 12.0% of GB employment in Q1 2016 (13.5% if agriculture and fishing are included along with self-employed farmers).

Non-residential catering accounts for 48% of the post-farm gate food chain. Employment in this sector increased 3.1% on Q1 2015, equating to around 50,000 jobs. Retailing accounts for around one third of food chain jobs (excluding agriculture) and also increased year on year by 1.3%, or around 15,000 jobs.

In Q1 2016, one half of food sector jobs were part time. Women accounted for 57% of employees in food retailing and 61% in non-residential catering.

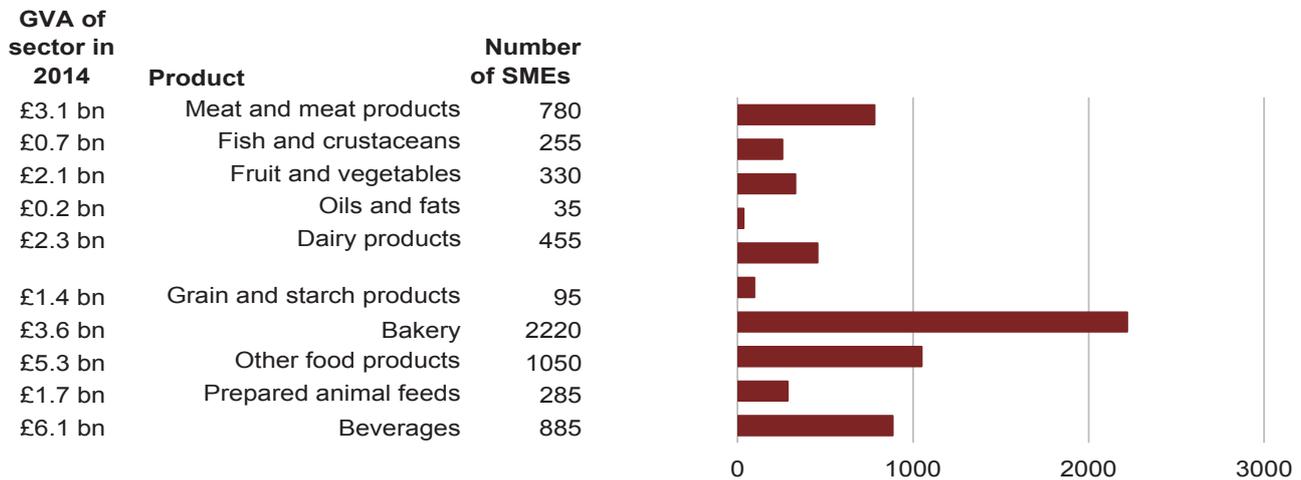

Source: *Labour Market Statistics (ONS) and June Survey (Defra)*.

⁵ Food' includes non-alcoholic drinks. 'Drink' is alcoholic drinks

1.5: UK food and drink manufacturing by product type⁶

There were approximately 6400 micro, small and medium sized enterprises (SMEs) in the food and drink sector with turnover of around £22 billion and 124,000 employees in 2015. In the food sector (excluding beverages) SMEs accounted for 94% of businesses, 32% of employment and 24% of turnover. More than a third of the 6100 SMEs are manufacturers of bakery products.

In terms of Gross Value Added (GVA) beverages (including soft drinks and mineral water) is the largest manufacturing group with a of £6.1 billion in 2014; contributing 23% to the total food and drink manufacturing GVA.

The 'other food products' category had a GVA of £5.3 billion. This includes items such as prepared meals, confectionery, condiments and seasonings.

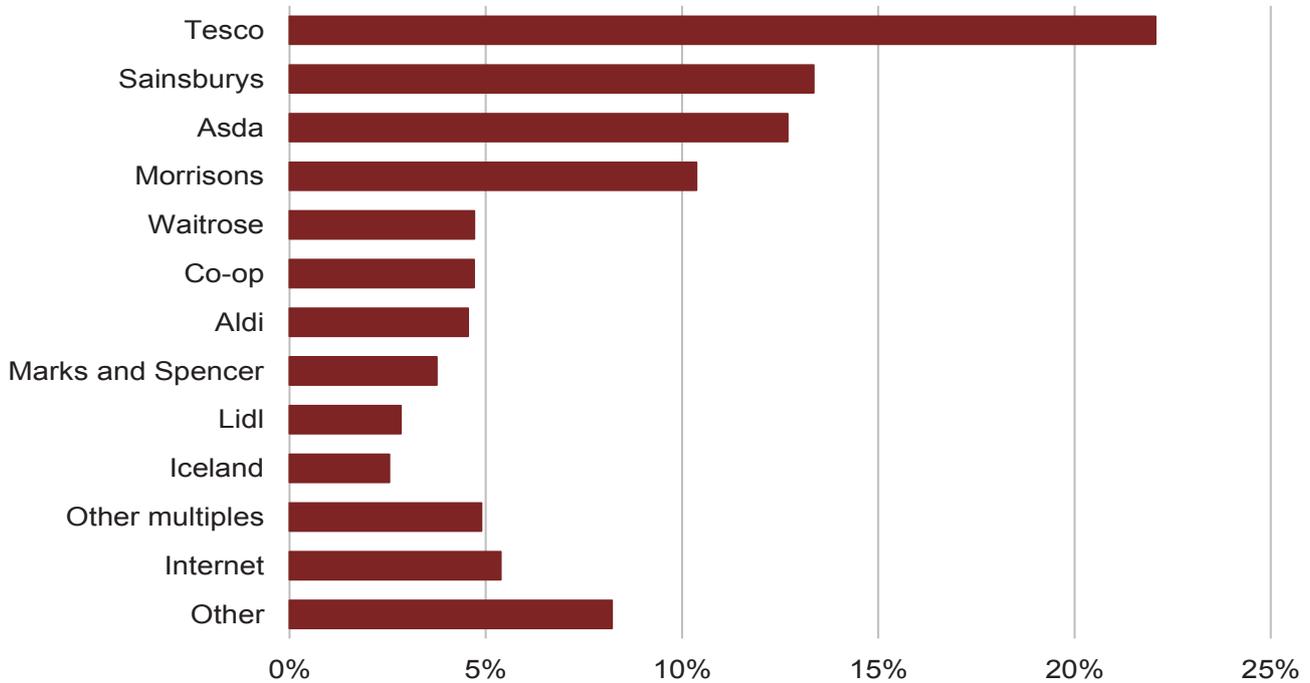

Source: *Annual Business Survey (ONS), Business Population Estimates (BIS)*.

⁶ For disclosure reasons some small contributions (less than 4% overall) to food and drink manufacturing GVA have been treated as zeros.

1.6: UK grocery market shares 2014

The combined market share of food and non-alcoholic drinks of the largest four food and drink retailers was 61% in 2014, up from 58% in 2013. Tesco commanded the largest market share at 21%, a decrease of 1 percentage point on 2013. The three largest discounters (Aldi, Iceland and Lidl) had a combined market share of 12%, up from 9.9% in 2013. Internet food shopping, which includes the largest supermarkets, increased to 5.5% of sales of food and non-alcoholic drinks, up from 5.4% in 2013.

Data comes from the Living Costs and Food Survey which is fully representative of UK household food shopping.

Alternative market share estimates from the Kantar Worldpanel⁷ are more up to date although not restricted to foods and not as representative. In 2016 compared to 2015 (based on 12 weeks ending 14 August) Kantar Worldpanel shows Aldi and Lidl gaining 0.6% and 0.4% respectively, whilst Tesco fell 0.2% and Asda 0.9%.

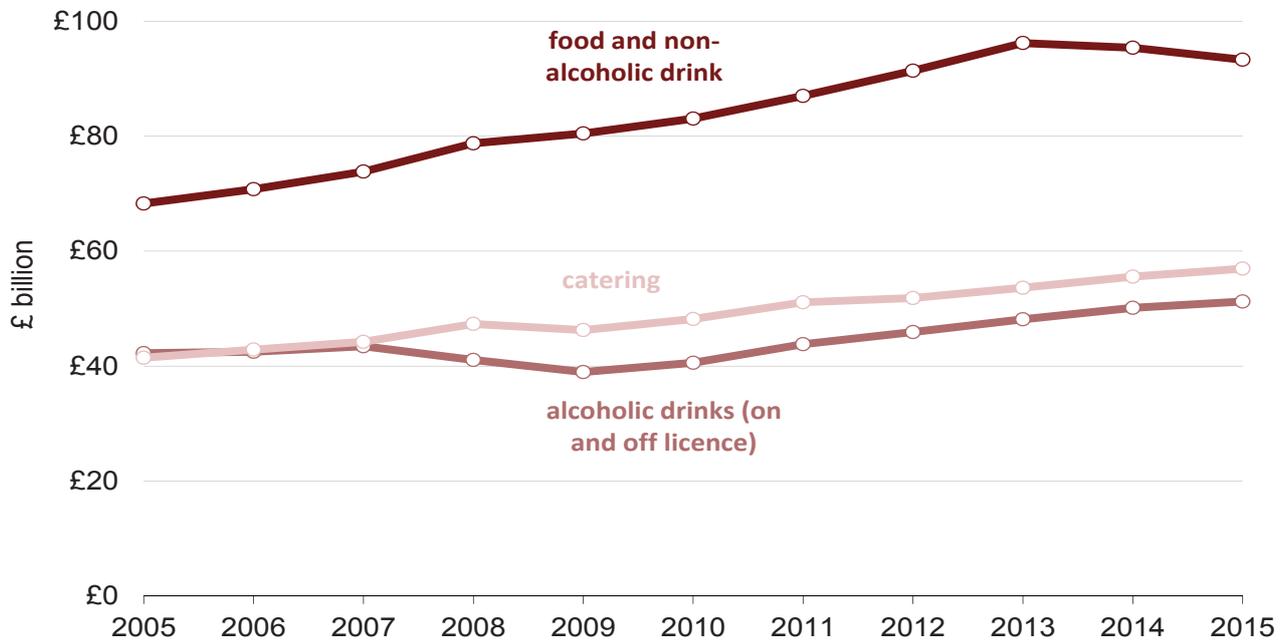

Source: Living Costs and Food Survey (LCFS) 2014, (Defra/ONS)

⁷ Kantar Worldpanel is a market research company, providing up to date statistics on sales by the grocery sector. Market shares also include sales of non-food.

1.7: UK Consumer expenditure on food⁸, drink and catering

Total consumer expenditure on food, drink and catering has continued to rise, by 0.2% in 2015 to £201 billion. Expenditure on food (including non-alcoholic drinks) fell by 2.2% to £93 billion. Spend on alcoholic drinks increased 2.2% and catering increased 2.5%.

Spend on food shopping has increased 26% since 2007. In 2015 it accounted for 46% of spend in the sector. Spend on catering accounted for 28% of sector spend in 2015 and has increased by 29% since 2007.

Spend on all alcoholic drinks accounted for 25% of sector spend in 2015. It has increased by 18% since 2007. Spend reduced between 2007 and 2009, but has increased yearly thereafter.

Source: *Consumer Trends*, (ONS).

Status:

⁸ Food' includes non-alcoholic drinks. 'Drink' is alcoholic drinks

2 Prices and Expenditure

2.1: UK trend in food prices in real terms, January 1996 to July 2016¹

Food prices rose 11.5% in real terms between 2007 and their peak in June 2012 as measured by the Consumer Price Index, following a long period in which they had fallen. Gradual price reductions since 2013 have reduced that real terms increase to 4.1% compared to 2007.

In the past 12 months food price inflation has fallen in real terms by 3.2%.

Successive spikes in the price of agricultural commodities since 2007 have led to higher retail food prices. They have not returned to the low price levels of pre-2007.

Oil prices also rose over this period, and inflation was higher than historically, but food prices have risen above inflation.

Those on lower incomes tend to buy different food items to those on average or high incomes but food prices for these different shopping baskets have risen at about the same rate.

A rise in food prices is more difficult for low income households to cope with because those on low incomes spend a greater proportion of their income on food - a rise in food prices has a disproportionately large impact on money available to spend elsewhere.

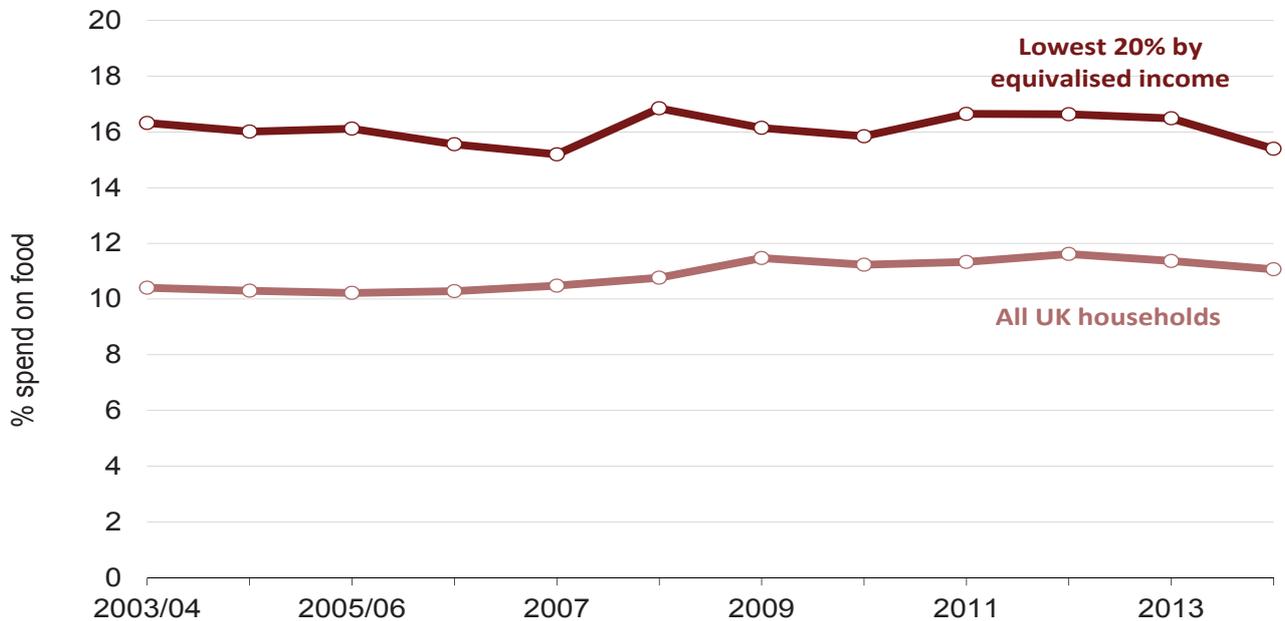

Source: *Consumer Price Indices*, (ONS).

¹ Excludes alcoholic drinks and catering.

2.2: Trend in share of spend going on food and drink² in low income and all UK households, 2003-04 to 2014

The relative affordability of food can be measured by the share of the household budget that goes on food. Low income households are of particular concern as they tend to have a greater percentage of spend going on food.

Food is exerting greater pressure on household budgets since 2007 when food prices started to rise in real terms.

Averaged over all households 11.1% of spend went on food in 2014, 0.6 percentage points above the 2007 level.

For households in the lowest 20% by equivalised income³ 16.4% of spend went on household food, 0.2 percentage points above 2007.

In 2014, the energy content of household food purchases in income decile 2 was 20% lower than in 2007 at 1783 Kcals/person/day; in decile 1 the energy content was 7.9% lower than in 2007 at 1810 Kcals/person/day.

Source: *Living Costs and Food Survey (Defra/ONS)*, *Family Spending table 3.2e (ONS)*.

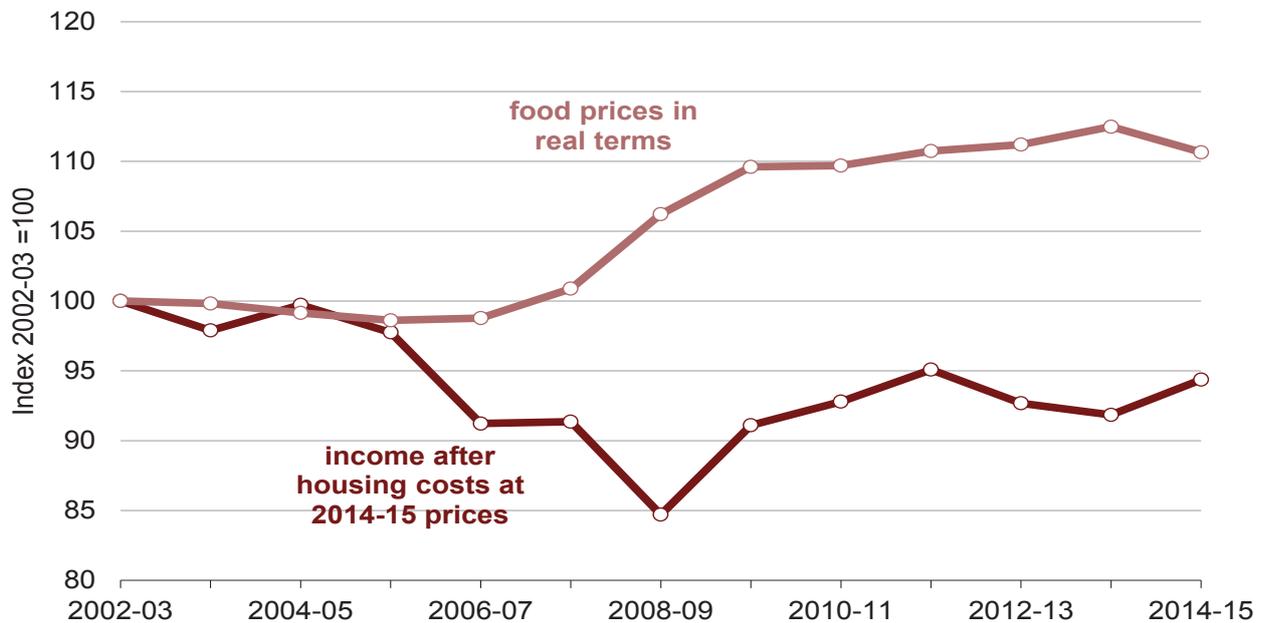

² Excluding alcoholic drinks.

³ See Glossary for definition of equivalised income.

2.3: Income decline after housing costs, low income⁴ decile (UK)

Median income after housing costs fell 4% between 2003-04 and 2014-15 for low income decile households. Over the same time period, food prices (in real terms) increased 11%. In 2008-09 the median income for low income decile households reached its lowest level, 17% below that of 2002-03. Small decreases between 2011 and 2014 were partially reversed 2014-15 when income increased by 2.7%, coinciding with a 2.0% fall in food prices.

In 2014-15, all income groups with the exception of the lowest, saw increases in median income of between 2.4% and 4.7% (deciles 2 and 6). All but the lowest income decile group are above the 2003-04 level.

The most commonly used threshold of low income in the UK is having an income which is less than 60% of the median. In 2013-14 the percentage of individuals in relative low income (before housing costs) was 16%⁵, equating to around 10.1 million individuals.

Source: *Living Standards, Poverty and Inequality in the UK, 2015; Institute for Fiscal Studies.*

⁴ See Glossary for definition of Low income.

⁵ Households Below Average Income, DWP June 2016.

2.4: UK retail price changes by food group, 2007 to 2016

	% increase in price June 2007 to June 2016	
All items CPI	23	
Catering	30	
Food and non-alcoholic beverages	27	
Vegetables, potatoes	14	
Alcoholic drinks	17	
Milk, cheese, eggs	19	
Processed food	24	
Soft drinks	24	
Meat	26	
Bread, flour, cereals	27	
Fish	28	
Coffee, tea, cocoa	36	
Fruit	36	
Sugar, Jam, confectionery	40	
Butter, margarine,cooking oil	45	

All foods groups have risen in price since 2007 (the start of the recession), with rises ranging from 14% to 45%. Coffee, tea and cocoa, fruit, sugar, jam and confectionery, and butter, margarines and oil prices have all risen by 30% or more since June 2007. Food prices (including non-alcoholic drinks) rose 4.1% in real terms between 2007 and 2016.

Rising prices seen up to 2014 have begun to fall over the last couple of years. In the year to June 2016 prices fell in most food groups with the exception butter, margarine and cooking oil, which increased by 2.0%. Fruit, coffee and tea, and processed foods showed marginal increases of 0.3%. Catering increased by 2.2%.

Vegetables, potatoes and dairy products saw the greatest falls, both down by over 6.0% in the year to June 2016. Prices of meat and fish both fell by over 4.0%, whilst bread, flour and cereals, butter, margarine and oils, sugar, jam and confectionery, and soft drinks all fell by between 1.0% and 2.0%.

Food price rises have a strong effect on food shopping for low income households. Since 2007, households in income decile 1 (lowest income group) bought less lamb, beef, butter, bread, sugar and preserves, but bought more pork, eggs and sweets and chocolates⁶.

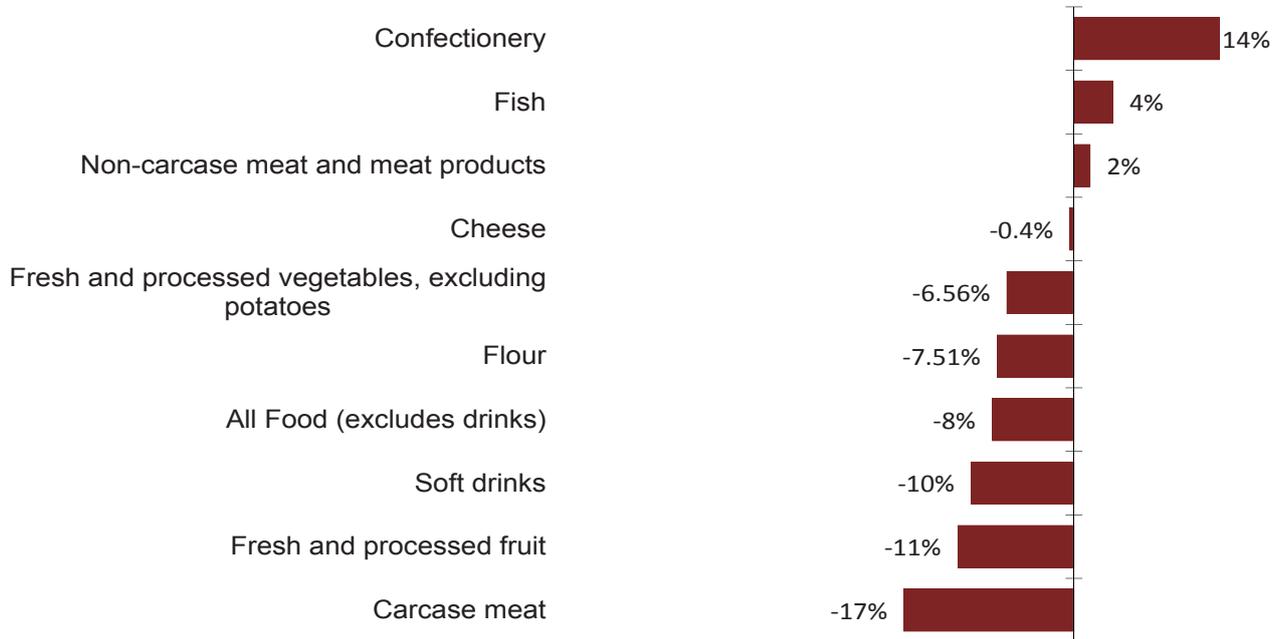

Source: *Consumer Price Indices*, (ONS).

⁶ Family Food 2014, Defra, December 2015.

2.5: Percentage change in food purchases 2007-2014, in low income households (UK)

In 2014 compared to 2007, the lowest income households (equivalised income⁷ decile 1) purchased 17% less carcass meat, 11% less fresh and processed fruit and 10% less soft drinks.

Purchases of confectionery increased 14% between 2007 and 2013 and purchases of fish increased 3.8%.

Between 2007 and 2014, average households traded down to cheaper products to save 5.5% while the lowest income households traded down to a much lesser extent, possibly as they were already buying cheaper products.

Food is the largest item of household expenditure for low income households after housing, fuel and power costs.

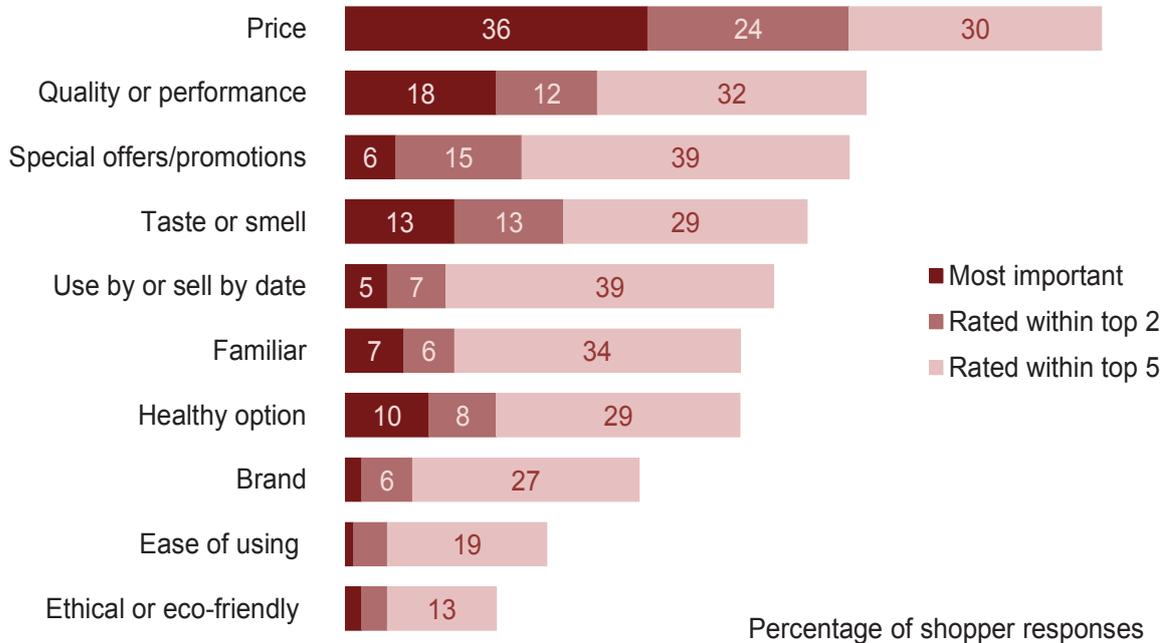

Source: *Family Food 2014*, Defra.

⁷ See Glossary for definition of equivalised income

2.6: Factors influencing consumer product choice⁸

Price is increasingly important in driving product choice, with 36% of shoppers naming it as the most important factor and 90% listing it within their top five influences. Quality was rated as the highest influence by 18% of respondents, followed by taste or smell (13%) and a healthy option (10%).

Quality is highly influential with 62% listing it in the top 5 factors, although only 18% considered it most important. Only price featured more highly as a top 5 influence.

Use by dates were considered most important by only 5% of shoppers although half (51%) of shoppers included it in their top 5 influences. Taste or smell were considered most important by 13% of shoppers. Familiarity and brand names still have a sway in many purchase decisions, with 47% and 35% of shoppers naming them in their top 5 influences.

Ethically produced products and whether a product was easy to use were considered least important factors with 18% of shoppers listing them in their top 5 influences.

Table 7.4 shows another analysis of consumer product choice relating to ethical and environmental factors.

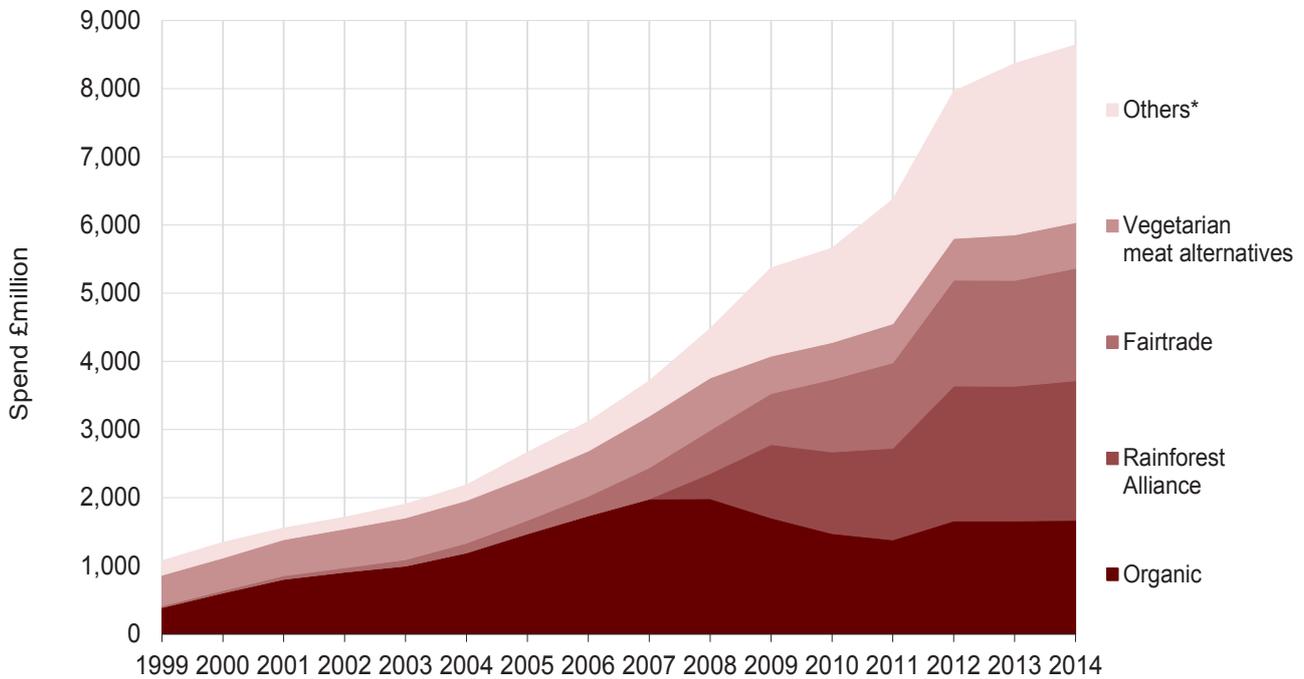

Source: IGD ShopperVista 2014.

⁸ IGD ShopperVista 2014, base: all main shoppers, fieldwork June 2014. Sample is managed to be representative of main grocery shoppers but may contain unquantifiable biases.

2.7: UK trend in sales of ethical produce

*Others include free range eggs and poultry, freedom foods and sustainable fish.

Sales in “ethical” food and drink, including organic, fair-trade, free range and freedom foods rose to £8.5 billion in 2014⁹, 9.2% of all household food sales.

Sales of ethical produce have increased year on year since 2007, despite the economic downturn. Rainforest Alliance made up the largest single share in 2014, accounting for 24% of the total ethical food sector at £2.0 billion; an increase of 3.6% on 2013. Fairtrade and organic products are the next largest contributors at 19% each (£1.6 bn and £1.7 bn respectively).

Sales of organic food and drink have been steady in the last few years, although still 16% down on their peak in 2008.

Sales of sustainable fish rose by 12% in 2014 to £0.5 billion.

Figures are determined by the Ethical Consumer Market Report by The Ethical Consumer Research Association based on administrative data held by ethical labelling organisations, trade associations and market research data.

Source: *Ethical Consumer Market Report 2015*, Ethical Consumer Research Association.

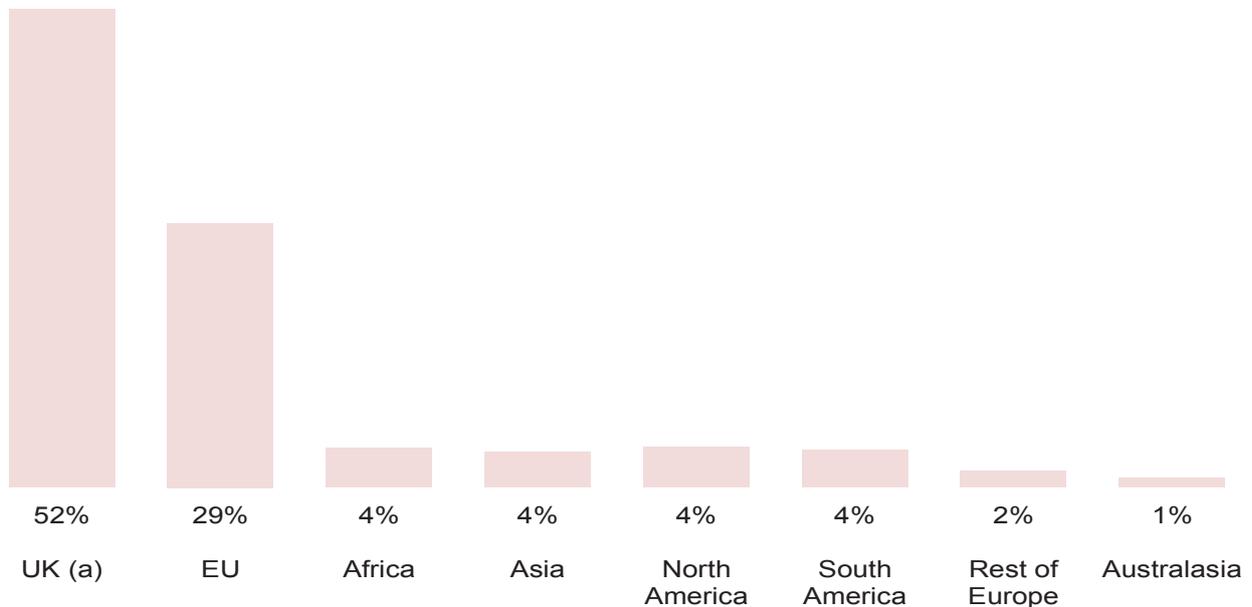

⁹ Excludes food and drink boycotts.

3 Global and UK Supply

3.1 Origins of food consumed in the UK, 2015¹

(a) Consumption of UK origin consists of UK domestic production minus UK exports.

Sourcing food from a diverse range of stable regions, in addition to domestically, enhances food security².

Based on the farm-gate value of unprocessed food in 2015, the UK supplied over half (52%) of the food consumed in the UK. The leading foreign suppliers of food consumed in the UK were countries from the EU (29%) and Africa, Asia, North and South America, all providing a 4% share of the food consumed in the UK.

Two countries accounted for 69% of UK imports of fresh vegetables. Three countries accounted for 54% of unmilled wheat imports, and four countries accounted for 44% of UK imports of fresh fruit.

Source: Defra.

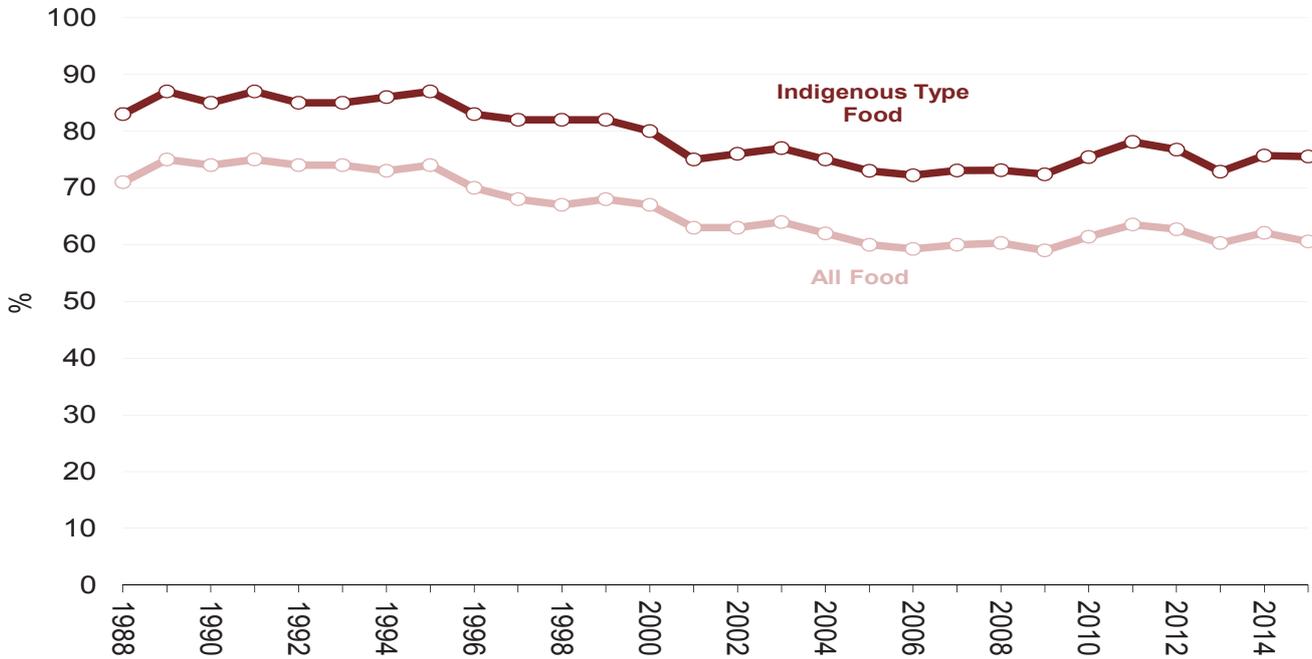

¹ 2015 figures are provisional.

² UK Food Security Assessment, January 2010 (Defra).

3.2: UK Food production to supply ratio, 1998-2015

Food Production to Supply Ratio is calculated as the farm-gate value of raw food production (including for export) divided by the value of raw food for human consumption. It provides a broad indicator of the ability of UK agriculture to meet consumer demand.

A high production to supply ratio fails to insulate a country against many possible disruptions to its supply chain.

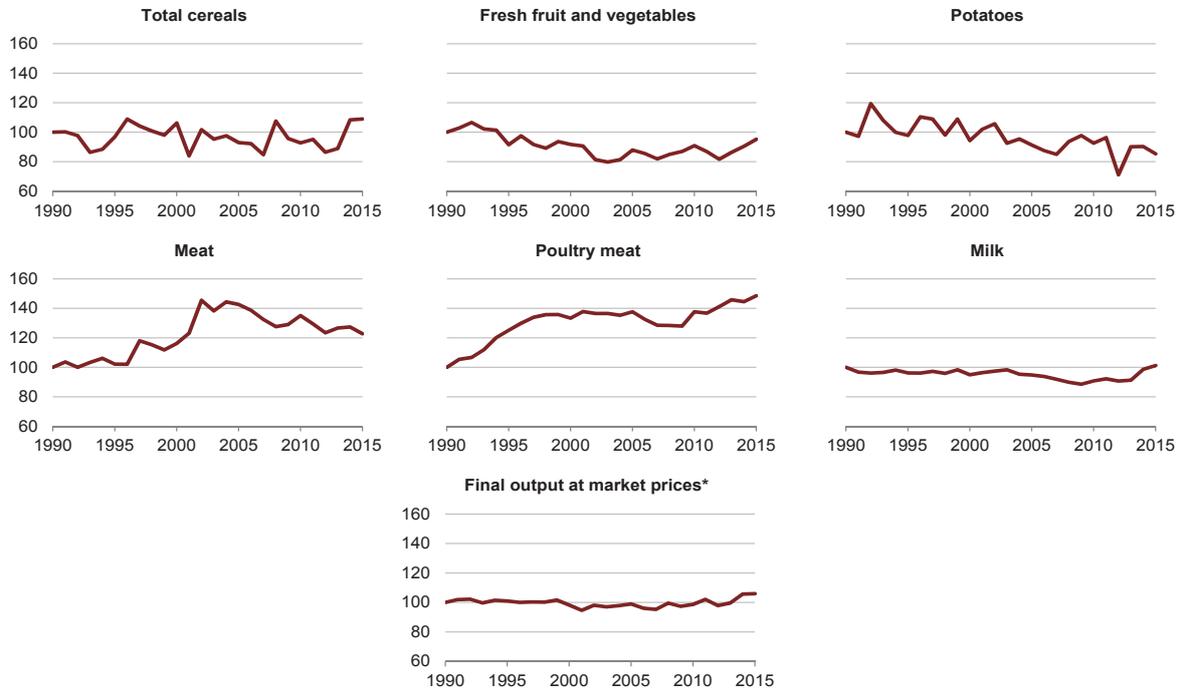

The ratio in 2015 was 61% for all food and 76% for indigenous type food. This compares with 62% and 76% respectively in 2014.

Source: *Agriculture in the United Kingdom*, Defra.

3.3: Trends in UK food production

Final output³ of UK agriculture is a proxy for UK food production. The volume of all outputs rose by 0.3% between 2014 and 2015⁴, which is the highest level recorded for the UK.

Total UK cereal production has fluctuated, with significant dips in 2001, 2007, 2012 and 2013, linked to adverse weather conditions in those years. 2015 saw little overall change in production compared to 2014, reflecting above average across all cereals.

Since 1990 there have been large increases in production levels of poultry meat, part of a longer term upward trend since the late 1970's. Although production dipped during the 2000's it reached a record level in 2013. Following a slight fall in 2014 total production of poultry increased by 2.8% in 2015.

Red meat production showed a downward trend through much of the 1990's, driven by a combination of factors including the beef export ban. Since 2002 there has been a slight upward movement but levels still remain lower than those in the early 1990's.

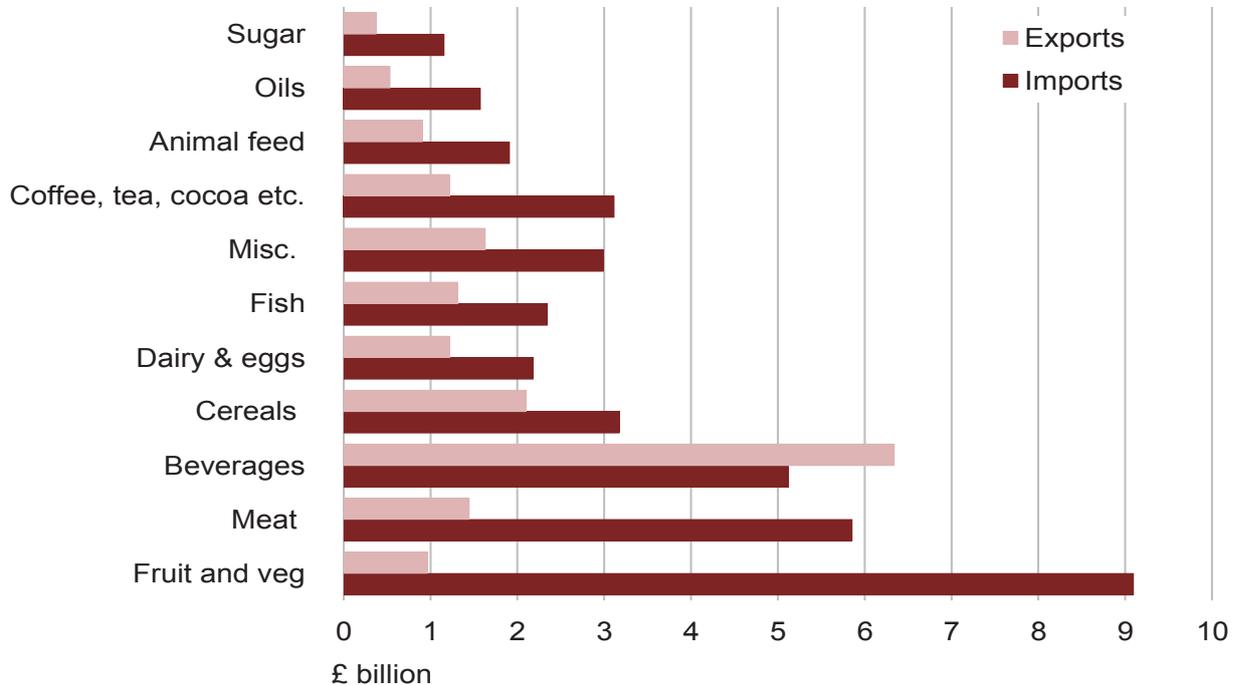

Source: *Agriculture in the United Kingdom*, Defra.

³ Gross output less transactions within the industry.

⁴ 2015 figures are provisional.

3.4 UK trade in different food groups, 2015⁵

The value of imports is greater than the value of exports in each of the broad categories of food, feed and drink except 'Beverages' which had a trade surplus of £1.22 bn in 2015, largely due to exports of Scotch Whisky.

Beverages are the largest export category by far with an export value of £6.3 bn in 2015. Exports (at 2015 prices) rose 23% between 2009 and 2011, due largely to increases in the existing markets. Decreases between 2013 and 2015 have reduced the export value by 6.4% (£1.2 billion).

Cereals is the second largest export group with a value of £2.1 bn, followed by the meat and fish categories at £1.4 and £1.3 bn respectively.

'Fruit and vegetables' has the largest trade deficit. In 2015 imports cost £9.1 bn while exports were worth £1.0 bn, giving a trade gap of £8.0 bn.

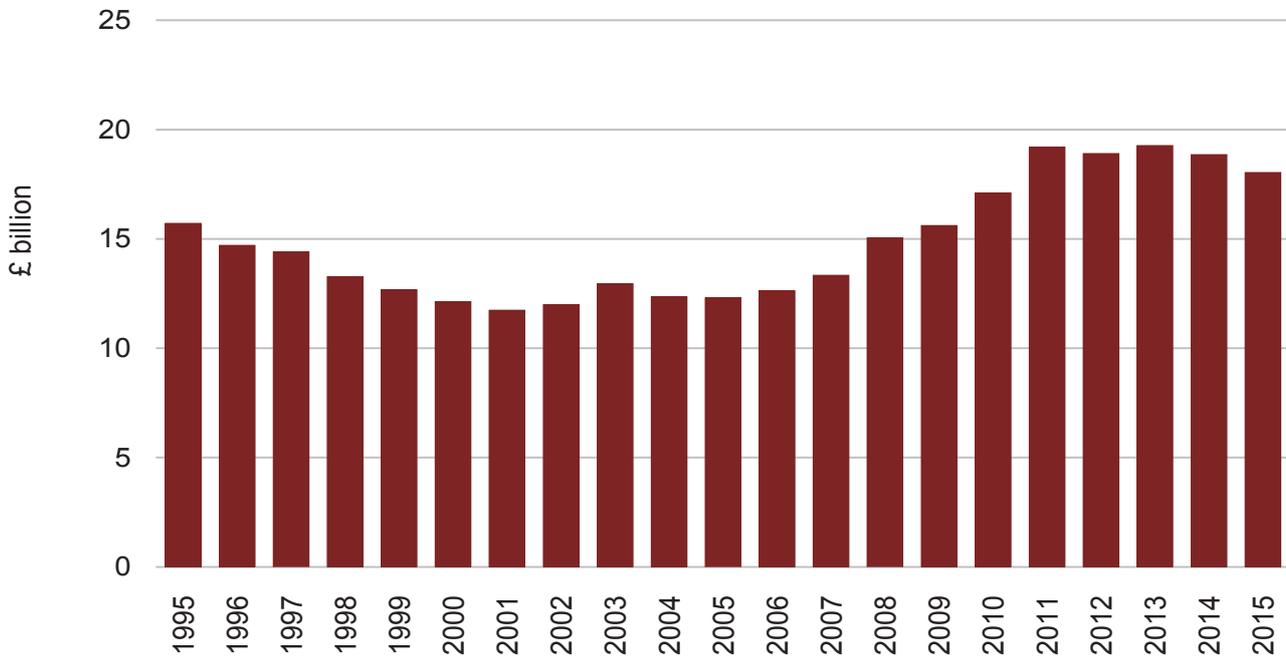

The second largest groups in terms of imports in 2015 were meat and beverages with imports of £5.9 and £5.1 bn respectively.

Source: HM Revenue and Customs.

⁵ 2015 figures are provisional.

3.5: Trend in exports of food, feed and drink⁶

The total value of food and drink exports fell slightly in 2015 to £18.0 billion, £5.7 billion more than in 2005 measured in 2015 prices although still lower than the peak of £19.2 billion in 2011.

Cereals had the greatest value increase at £155 million (8.0%). Exports of vegetables and fruit increased by £57 million (6.3%) and exports of animal feed increased by £7 million (0.8%).

Dairy products and birds eggs had the greatest reduction in value at £284 million (19%), largely removing the increases seen in 2013 and 2014. Exports of meat and fish also fell in 2015 by 13% and 16% respectively.

The trade deficit in food, feed and drink fell slightly in 2015 to £20.5 billion. It is £3.8 billion higher than in 2005 measured in 2015 prices.

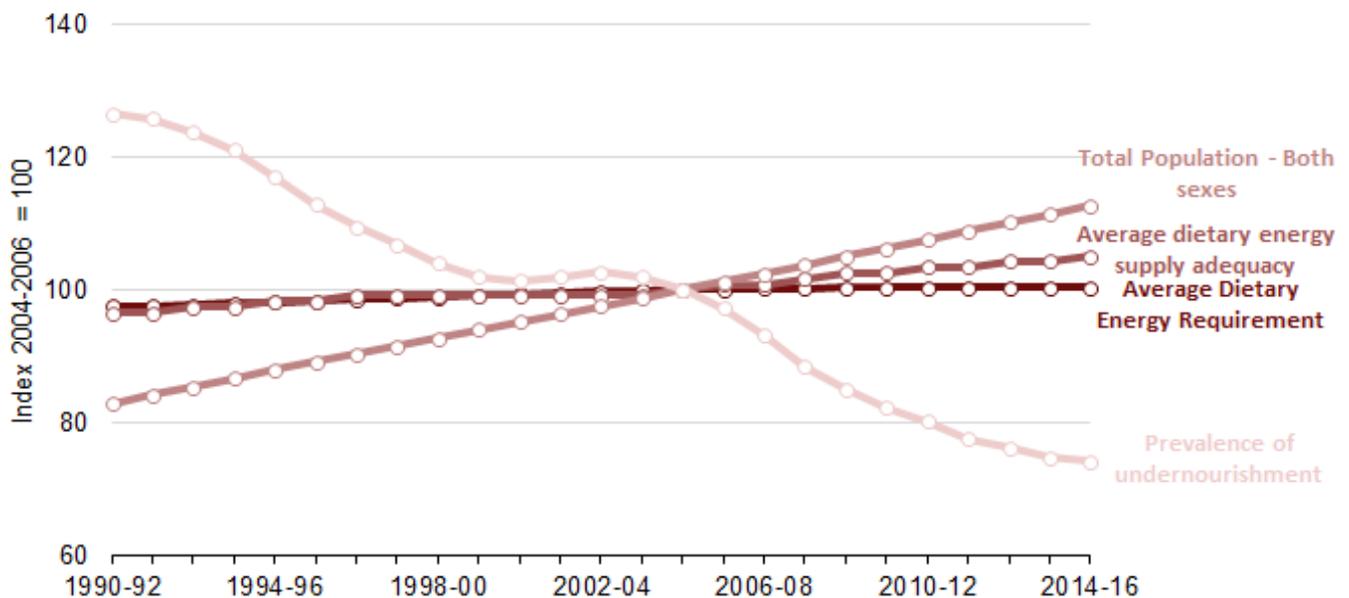

Source: *HM Revenue and Customs*

⁶ 2015 figures are provisional.

3.6: World trends in population, energy requirement, energy supply and prevalence of under-nourishment⁷

The average of individual dietary energy requirement (ADER), calculated as Kcal/capita/day, is a reference for adequate nutrition in the population. Its value can be used to calculate the depth of the food deficit (FD)⁸.

The dietary energy supply, calculated as Kcal/capita/day, has increased 8.8% since 1990-92.

World population is currently growing 1.2% per year and increased 36% between 1990-92 and 2014-16.

Undernourishment reflects a shortage of food energy to sustain normal daily activities, affected by the amount of food available and by its distribution.

The prevalence of under-nourishment in the world has fallen 52 points since 1990-92⁹.

Source: *Food Security Indicators (FAO)*.

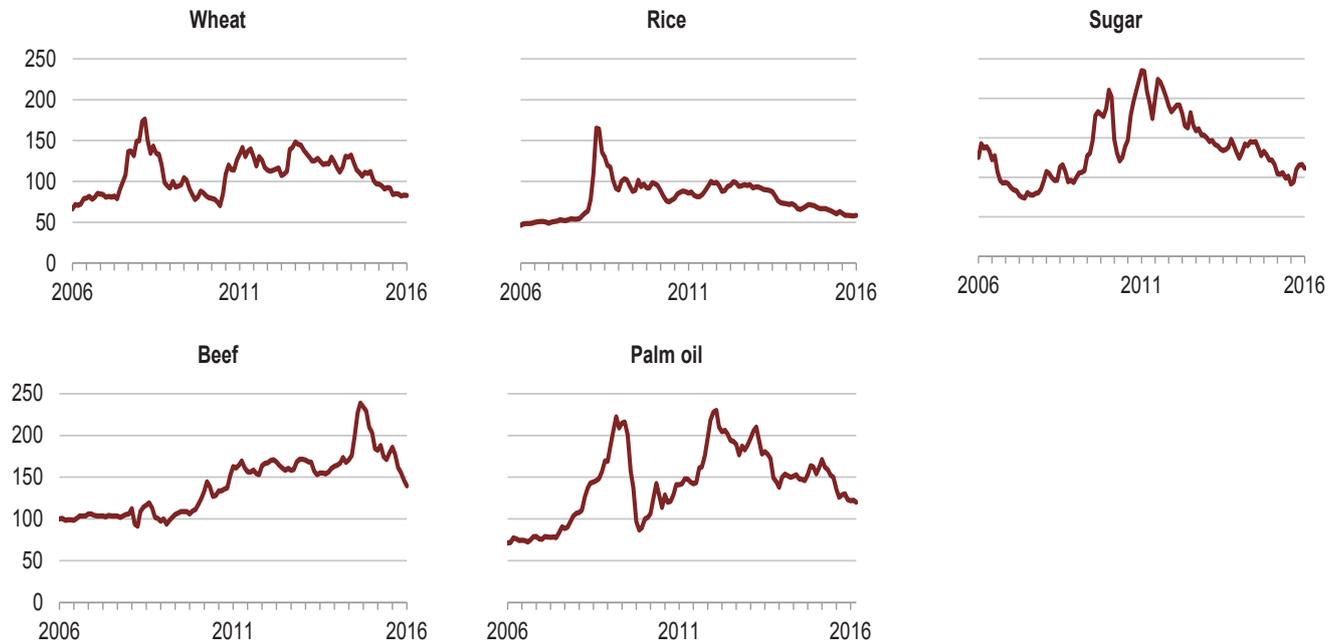

⁷ Calculated on three-year average to reduce the impact of errors in recording annual stock variations.

⁸ The amount of dietary energy that would be needed to ensure that, if properly distributed, hunger would be eliminated.

⁹ Global Monitoring Report 2015, World Bank.

3.7: World agricultural commodity prices to June 2016

Wheat prices rose 38% between April and September 2012, caused by a major drought in the US “corn belt” and poor wheat harvests elsewhere.

Wheat prices peaked in March 2008, May 2011 and again in September 2012. The second and third spikes were not as high and reductions between September 2012 and June 2013, and since October 2014 have brought prices down to 56% lower than in 2008.

Sugar prices peaked in January 2011, 170% higher than in January 2007. A steady decline since then resulted in prices in March 2015 being 56% lower than the 2011 peak. Since then, sugar prices have risen, and in June 2016, the index stood at 154.5.

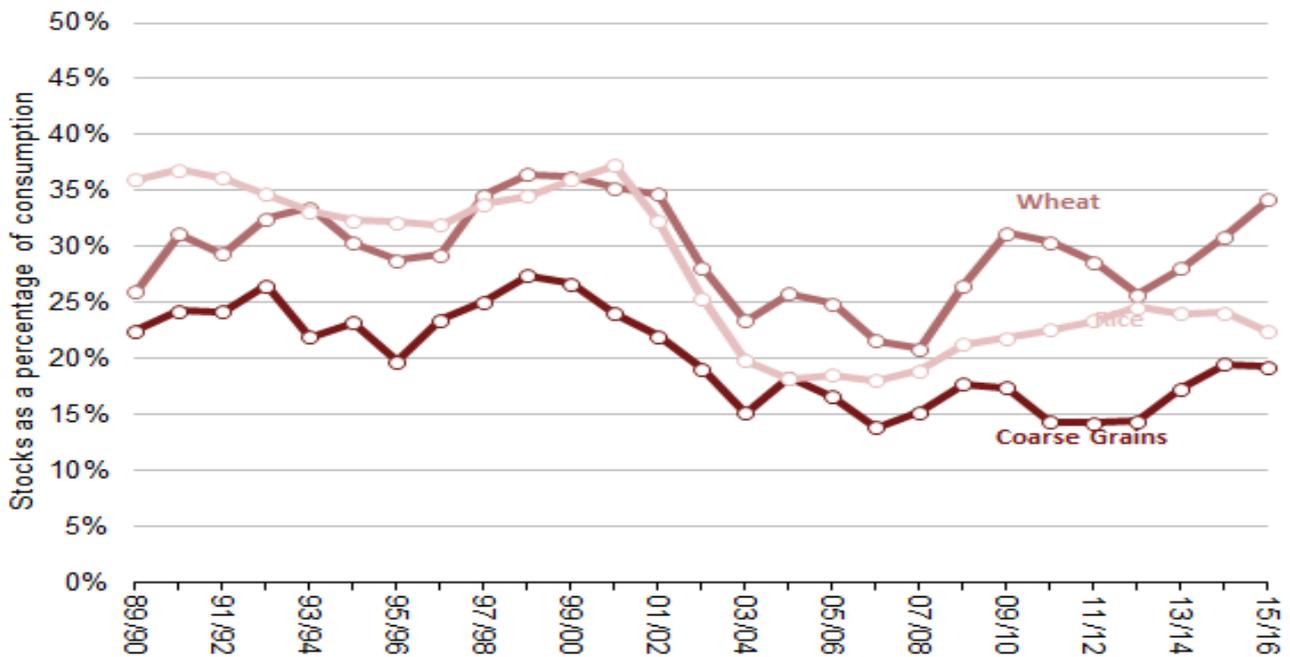

A downward trend followed the 2008 peak in rice prices until June 2010 with prices falling 55%. Prices rose steadily between June 2010 and the first half of 2011 since when there has been relative stability. Prices fell in late 2015, early 2016, but increased towards the mid-point of 2016.

Palm oil prices peaked in early 2011, 3.4% higher than the previous peak in early 2008. Since then, prices were on a downward trend despite some fluctuations in early 2012, and have risen in recent months in line with similar commodity prices.

Source: *United Nations Conference on Trade & Development (UNCTAD)*

3.8: World grains stocks to consumption ratio 2015-2016¹⁰

Stocks to consumption ratios are an indicator of global resilience to food shortages and price stability. With low stocks, markets become sensitive to further supply shortfalls, which magnifies the price response.

Wheat and Course Grain stocks have been on a rising trend in recent years, starting with the 2012-13 crop year¹¹. Rice stocks were on a general upward trend line from around the 2004-05 harvest.

Rice consumption (the denominator) is on a gradually rising trend, pushing the indicator onto a downward trend.

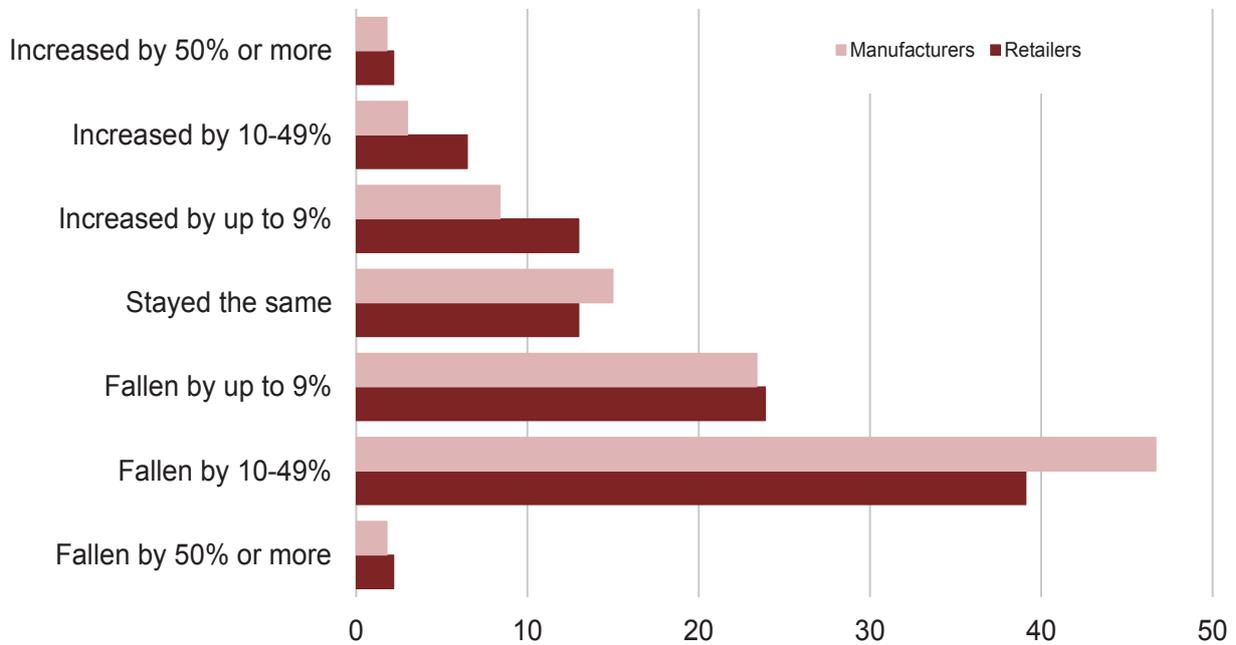

Source: *International Grains Council (IGC), United States Department of Agriculture (USDA)*

¹⁰ Starting this month, (August 2013) Production, Supply and Distribution (PSD) numbers for “European Union” reflect the addition of Croatia to the former EU-27. Croatia data no longer exists in the PSD after 1998/99; therefore, comparisons to data, including World Totals, will differ from those published prior to July 2013.

¹¹ USDA projections.

3.9: Retailer warehouse stock levels 5-year change

The industry has largely reduced warehouse stock levels. 72% of manufacturers and 65% of retailers have made at least some reduction.

The majority of retail supply chains have between one and four weeks of stock, with suppliers tending to hold higher levels of stock than retailers. For fresh produce, stock levels can sometimes be only 24 hours or less.

As retail supply chains become more responsive, lead times¹² are reducing and order frequencies are increasing.

Retailers are increasingly moving products into their stockless networks, managing products from across their ranges in the same way as the fresh and produce categories.

The impact of the current economic climate on consumer spending has helped drive this change as retailers look at ways of funding price cuts; supply chain operating costs and working capital tied up in inventory has provided such an opportunity.

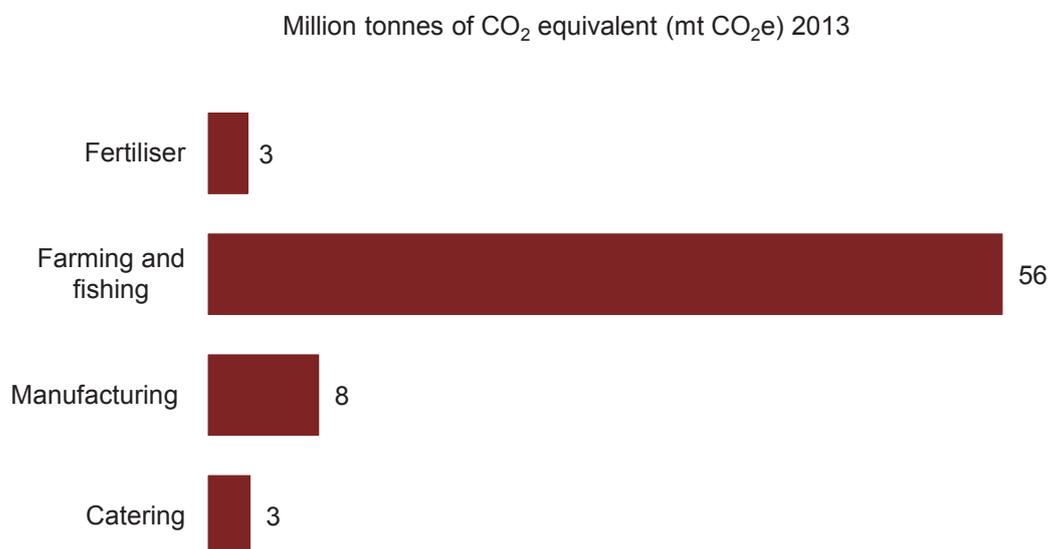

Source: IGD Research, 2013.

¹² The time between an order being placed and delivery.

4.1: Greenhouse gas (GHG) emissions from the UK agri-food sector, 2013¹

Four sectors were responsible for emitting around 70 million tonnes of CO₂ equivalent GHGs (mt CO₂e) from UK domestic food sector activity in 2013 (excluding emissions from non-fertiliser pre-farm production, land use change, food packaging, retailing, households, food waste and net trade). The largest contributor of the four sectors was farming and fishing, estimated at 56 mt CO₂e.

Emissions from farming and fishing remained relatively stable between 2012 and 2013. Excluding fishing, emissions from farming, which were estimated at around 55.6 mt CO₂e in 2013, have maintained a steady long-term decline. Enteric fermentation in ruminating animals and oxidisation of nitrogen in fertilisers is the source of most of the farming emissions.

In the other sectors, food and drink manufacturing emissions rose by 1.2% in 2013, while catering emissions also rose by 3.1%.

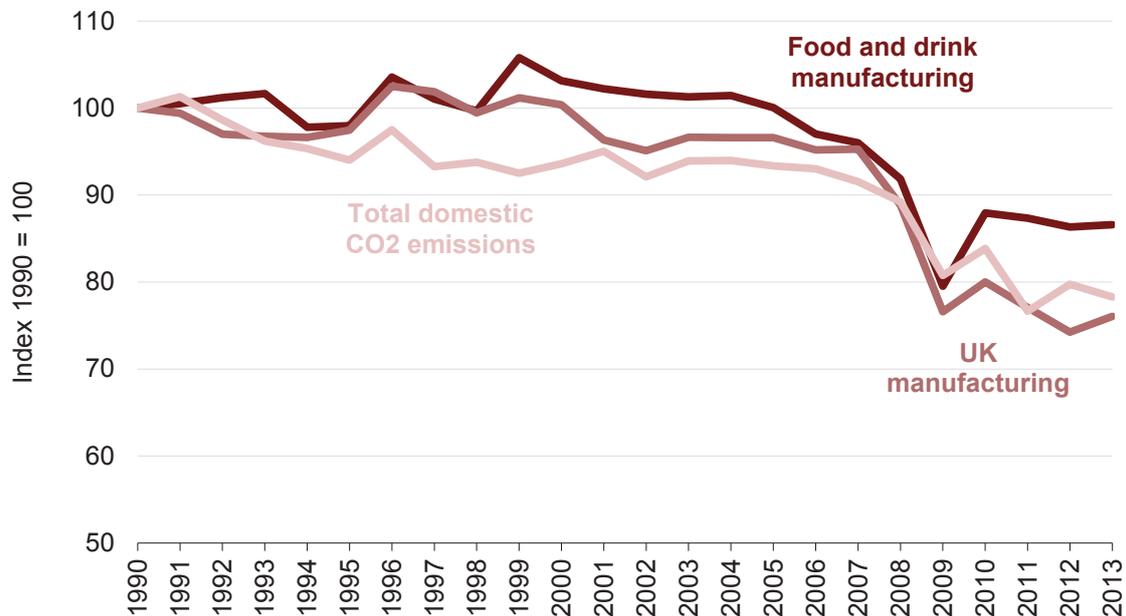

Source: UK Environmental Accounts, ONS 2015 British Survey of Fertiliser Practice

¹ GHG emissions from food packaging, food waste and land use change are not included. Manufacturing excludes emissions from electricity use and also excludes emissions from road freight transport. Household does not include emissions from heating water for washing up or dishwashers.

4.2: Trend in CO₂ emissions from UK food and drink manufacturing, 1990-2013²

CO₂ emissions from UK manufacturing, including food and drink manufacturing, have been on a downward trend since 1999, despite the occasional increase, including in 2013.

In all three sectors, there was a similar pattern between 2008 and 2011, with a decrease in CO₂ emissions in 2008 and 2009, an increase in 2010 and another decrease in 2011.

In 2013 UK manufacturing CO₂ emissions have increased by 2% while total domestic emissions have decreased by 2%. Food and drink manufacturing has remained unchanged since 2012.

The volume of output from food and drink manufacturing fell between 2007 and 2009 during the economic downturn, leading to a reduction in the level of CO₂ emissions.

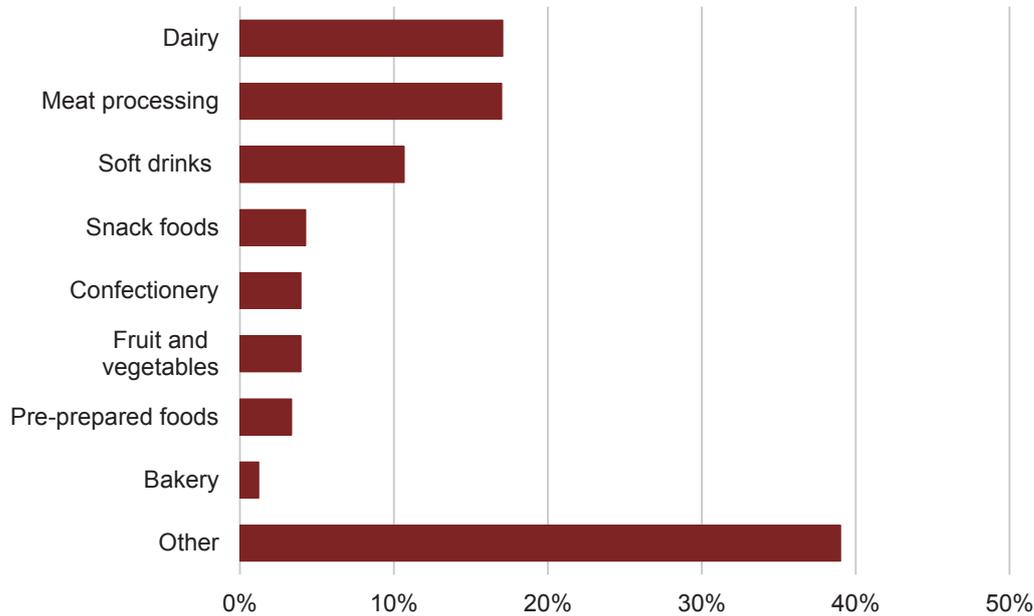

An increase in the volume of outputs along with a prolonged period of exceptionally cold weather produced an increase in emissions during 2010.

Source: *Environmental Accounts (ONS), Energy Consumption in the UK (DECC.)*

² Manufacturing figures include the share of CO₂ emissions relating to electricity production using a constant emission factor. Total domestic CO₂ emissions include net emissions/removals from land use and land use change but with no allowance for EU Emission Trading Scheme purchases.

4.3: Food and drink sub-sectors represented within the Federation House Commitment (FHC)³

Federation House Commitment⁴ is a voluntary agreement for the food and drink manufacturing sector. Its aim is to help reduce the stress on the nation's water supplies and contribute to an industry-wide target to reduce water use by 20% by 2020 against a 2007 baseline.

As of June 2014, the FHC has 70 signatories across 284 sites. Together, these signatories represent a quarter of UK food and drink manufacturing.

Between 2007 and 2013 these signatories collectively made a 16% reduction in their water use (excluding that in the product). This reduction is equivalent to 6.1 million m³ or 2,430 Olympic-size swimming pools, and is three-quarters of the way towards meeting the 20% reduction target by 2020.

Source: *Federation House Commitment (FHC), Progress report 2014 (WRAP)*.

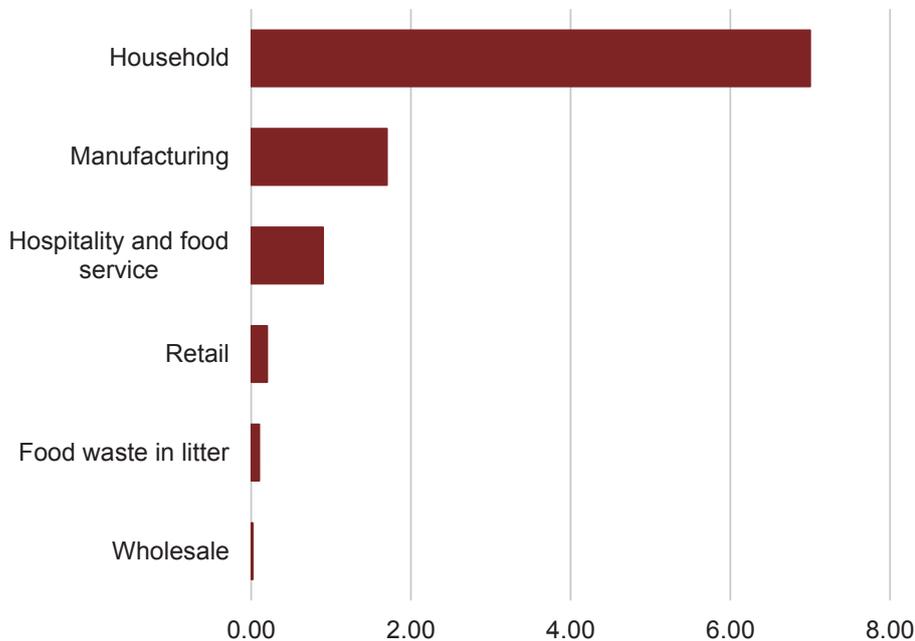

³ Meat processing includes red meat and poultry. 'Other' includes fish processing, alcoholic beverages, pet food and animal feed, milling, desserts, sauces and condiments.

⁴ The FHC is managed by WRAP in partnership with the Food and Drink Federation and Dairy UK and supported by the Environment Agency: More information at www.fhc2020.co.uk

5 Waste

5.1: UK food and drink waste through the food chain (million tonnes)

Around 10 million tonnes of food and drink is wasted in the food chain annually¹ in the UK. Around 41 mt of food are purchased in the UK annually (mainly for use in the home), meaning that the quantity wasted in the supply chain is equivalent to about one third of the food purchased.

The highest proportion of food and drink waste in the food chain was wasted in households, with 7 million tonnes being thrown away in the UK in 2012, of which 4.2 mt was avoidable, 1.2 mt was possibly avoidable and 1.6 mt was unavoidable.

Manufacturing contributed the second largest proportion of waste, at 1.7 mt, around half of which was avoidable. Grocery retail and wholesale together generated 0.2 mt.

Additionally, in 2015 0.7 mt of food surplus from manufacturing and retail was either redistributed via charitable and commercial routes (0.05 mt), or diverted to make animal feed (0.66mt). This material is prevented waste and not classified in the waste generation figures.

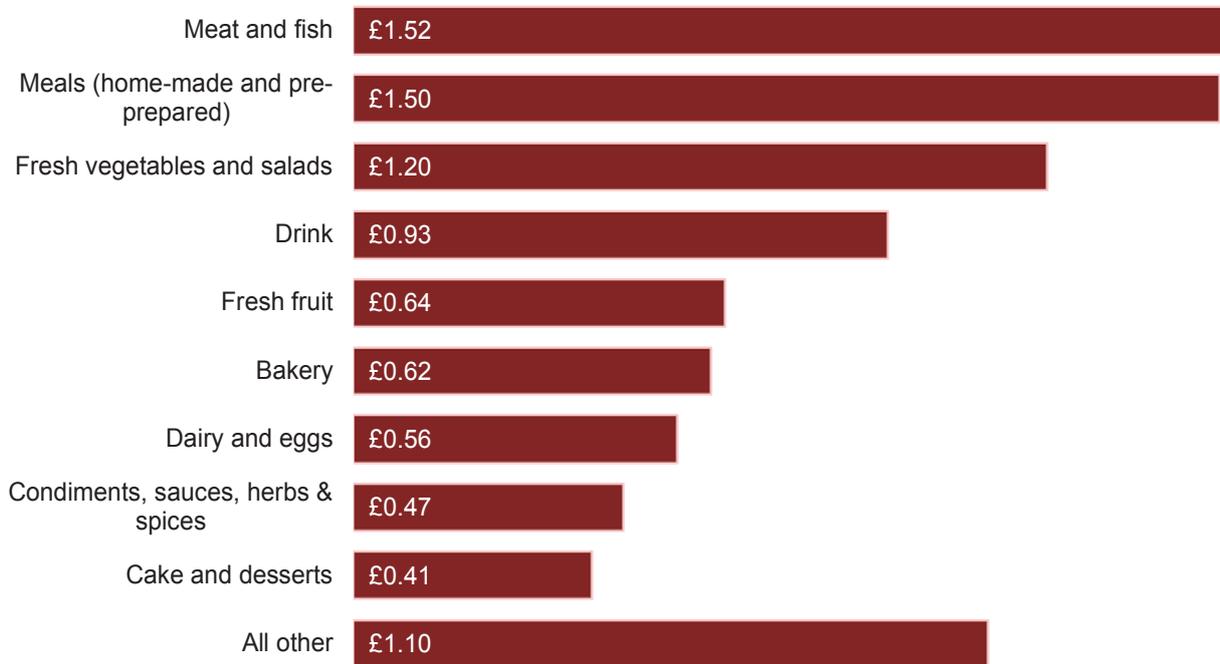

Source: *Handy Facts and Figures on Waste in the UK 2016*, WRAP.

¹ Data is based on various sector-specific WRAP reports (household and food waste in litter, 2012 data; manufacturing and retail, 2014 data; wholesale and hospitality and foodservice, 2011 data) and additional WRAP analysis of retail food waste based on 2014 British Retail Consortium (BRC) reported data

5.2: UK cost of avoidable food and drink waste per household per week, by food group, 2012

The retail price of avoidable food and drink² waste from UK homes was around £9 per household per week in 2012, or 14% of the £66 spent on average each week on household food³. The cost to the UK of avoidable food and drink waste in 2012 was £12.5 billion.

Meat and fish contributed the highest cost to avoidable food and drink waste at £1.52 (16.9%) per week, followed by homemade and pre-prepared meals at £1.50 (16.8%). Cakes and desserts contributed the least (not including other) at £0.41(4.6%), followed by condiments at £0.47 (5.2%).

Due to their high cost per kilogramme, meat and fish only contributed 7% in weight to the total avoidable food waste (17% in cost) whilst fresh vegetables and salad make up 19% in weight (13% in cost).

Source: WRAP Household Food and Drink in the United Kingdom 2012.

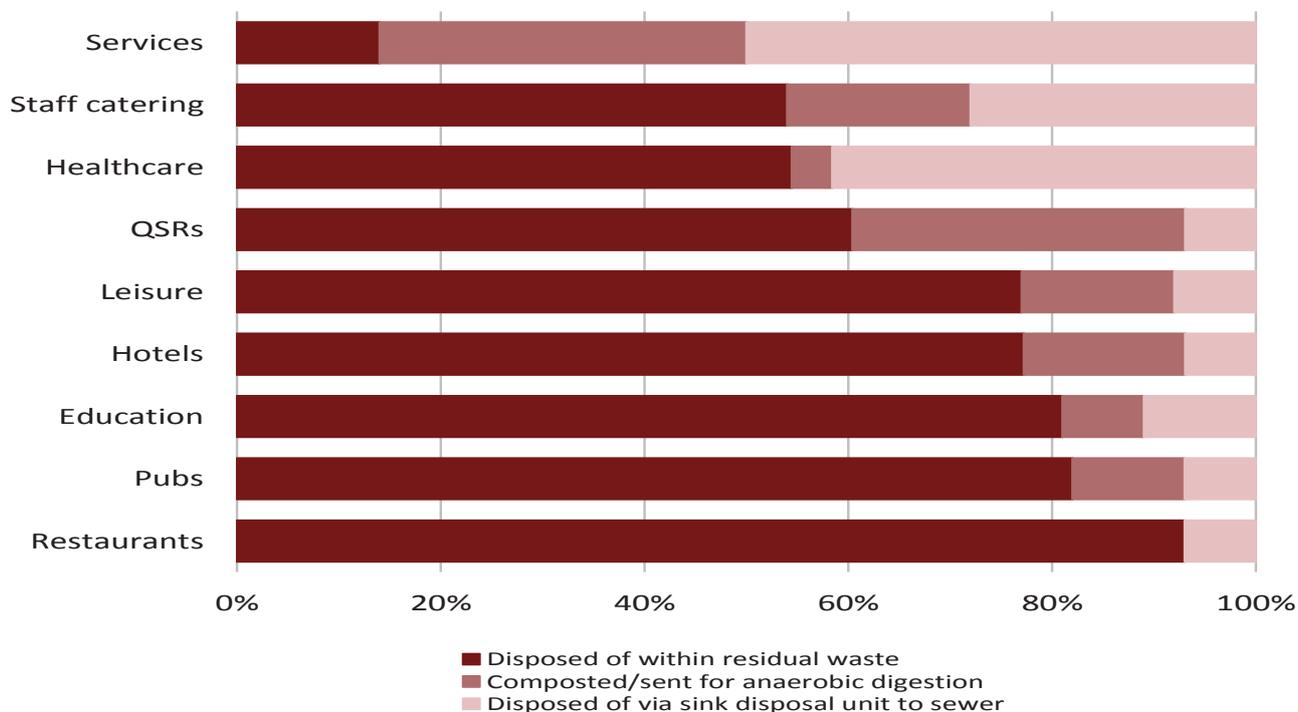

² Food and drink only includes those products brought back to the house, not food eaten out.

³ Household food expenditure was sourced from Defra's Family Food 2011

5.3: Management of Food Waste in the Hospitality and Food Sector (HaFS), by subsector, UK 2013⁴

Services and quick service restaurants (QSRs) composted the most food waste at 36% and 33% respectively, while restaurants didn't compost any. Education and healthcare composted the next least at 8% and 4% respectively.

Restaurants disposed of the largest proportion of food waste (93%) into the residual waste stream while services disposed of by far the least at 14%.

Services disposed of the majority of food waste via SDU (50%) followed by healthcare (42%). In 2013, 28% of food (by weight) purchased in services was wasted while only 3% was wasted from staff catering.

The cost in 2011 of food wasted in the HaFS was over £2.5 billion.

Source: *Overview of Waste in the Hospitality and Food Service Sector 2013*, WRAP.

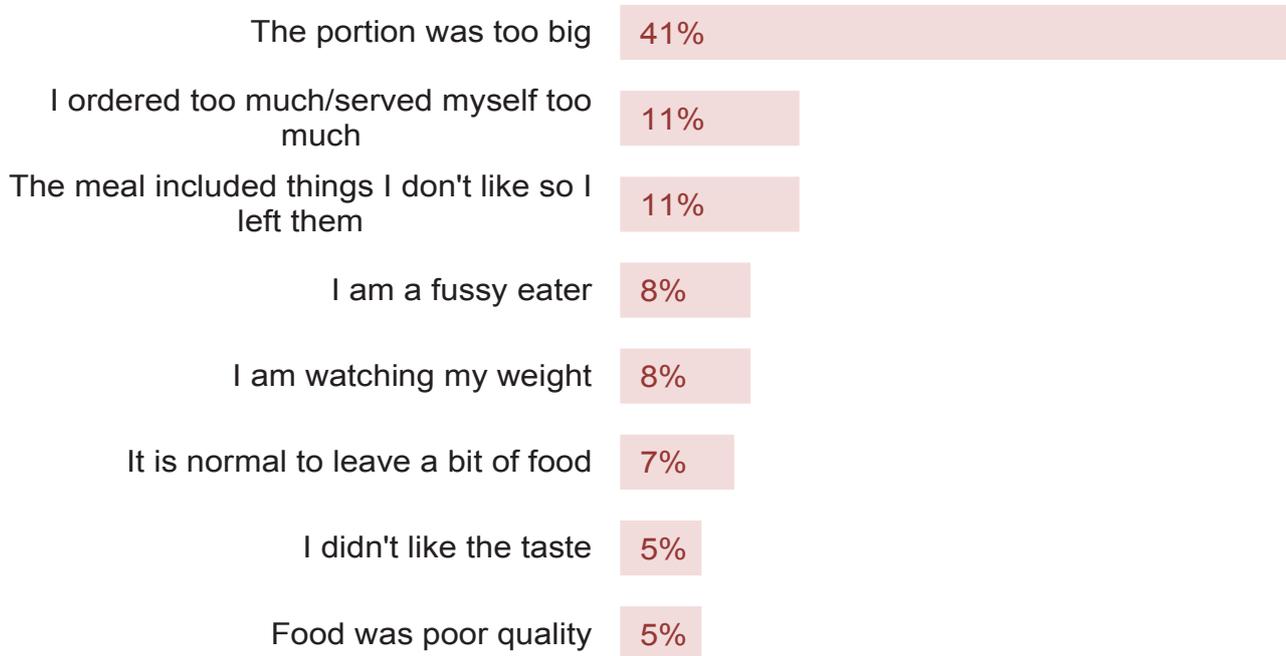

⁴ HaFS waste estimates have been compiled from waste reviews and surveys carried out in 2011 and 2013, and datasets collected between 2009 and 2012. Outlets from all HaFS subsectors were represented in the dataset, which included samples from 480 premises across England, Scotland and Wales.

All estimates presented in this summary report are subject to uncertainties. These relate to sampling error (i.e. the problem of trying to represent a large and varied sector based on a limited number of samples), uncertainties in extrapolating annual waste arisings from outlets based on 'snapshot' samples (typically a week's worth of waste), the extent to which samples successfully captured all HaFS waste arisings, and variation in methodology between different studies.

5.4: Understanding out of home consumer food waste (reasons why food was left)

Over half of meal leavers eating out linked leaving food to various aspects of portion sizes. Two fifths (41%) of meal leavers stated that one of the reasons why they had left food was because the portion size was too big and 11% stated that they ordered/served themselves too much.

Those that left food at the end of their meal mainly stated leaving chips (32%) and vegetables (18%). This is true across all types of venue though chips are even more likely to be left in quick service restaurants (45%) and pubs (38%).

A bigger proportion of meal leavers tend to leave food when eating out in either pubs, hotels or restaurants than other venues. The tendency to leave food at these venues could be that these diners attach more value to enjoying a meal out in a social setting than diners who are simply out to 're-fuel'.

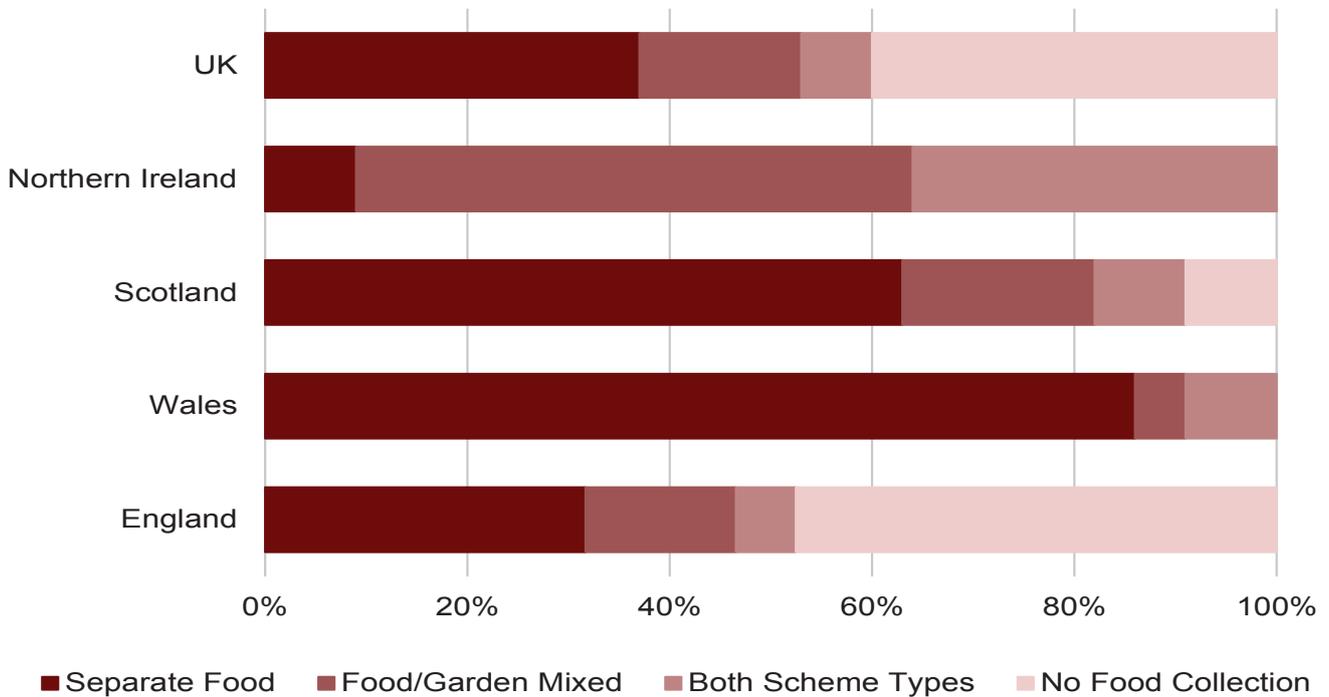

The research showed that customers take into account the cost and value of what they have actually ordered to decide whether to leave food and what part of the meal to leave. Parts of the meal which tend to be left are the main dish and the accompanying sides while appetisers, starters and desserts were less likely to be left.

Source: *Understanding Out of Home Consumer Food Waste 2013*, WRAP.

5.5: Proportion of local authorities collecting food waste, UK 2015/16⁵

In 2015/16 44% of local authorities in the UK had separate food waste collections, including 7% that ran both separate and mixed food/garden waste collections. 40% had no food collection at all (other than inclusion in regular residual or 'black bag' collection).

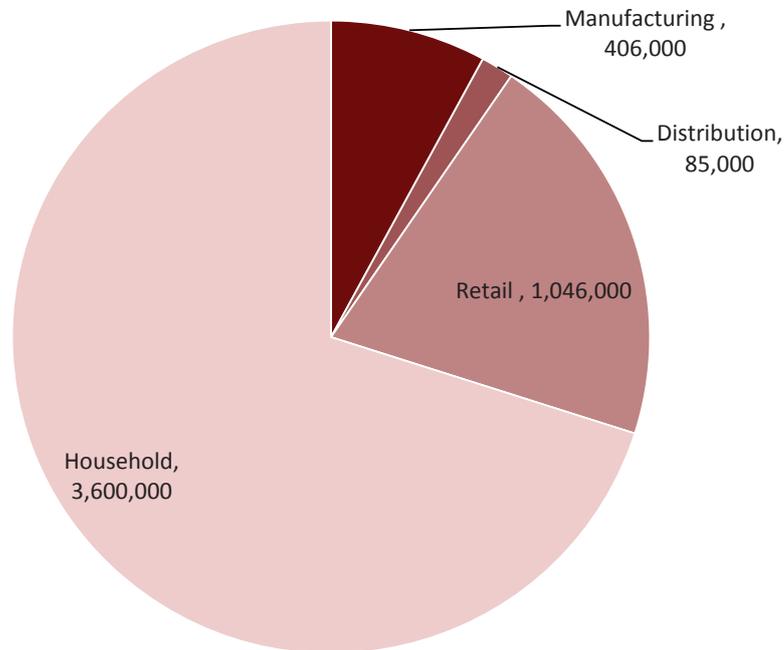

In Wales and Northern Ireland there were no authorities which did not collect food. In Wales 95% of authorities had separate food collection, and in Northern Ireland 45%, with the remainder made up of mixed food and garden waste. In England about half of local authorities had no food collection.

Source: WRAP, Local Authority Waste and Recycling Information Portal.

⁵In any authority a scheme may not be available to every household.

5.6: UK food and drink packaging waste in the supply to households

Packaging protects products in transit and helps maintain shelf life for perishable foods. An estimated 3.6 million tonnes of grocery packaging enters households which is over two thirds of the total grocery packaging waste.

Food and drink packaging emissions amount to 8.7 million tonnes of CO₂ equivalent (mtCO₂e), 6.1 mtCO₂e for household purchases.

The Courtauld Commitment is a responsibility deal between the UK grocery sector and WRAP, delivered in partnership with local authorities. Between 2010 and 2012 Phase 2 led to 1.7 million tonnes of food, drink and packaging waste being prevented, saving £3.1 billion. This represents a reduction of 4.8 million tonnes of CO₂eq. Phase 3, to run from 2013 and 2015, aims to lead to a reduction of 1.1 million tonnes of waste, a saving of £1.6 billion and a CO₂(e) reduction of 2.9 million tonnes.

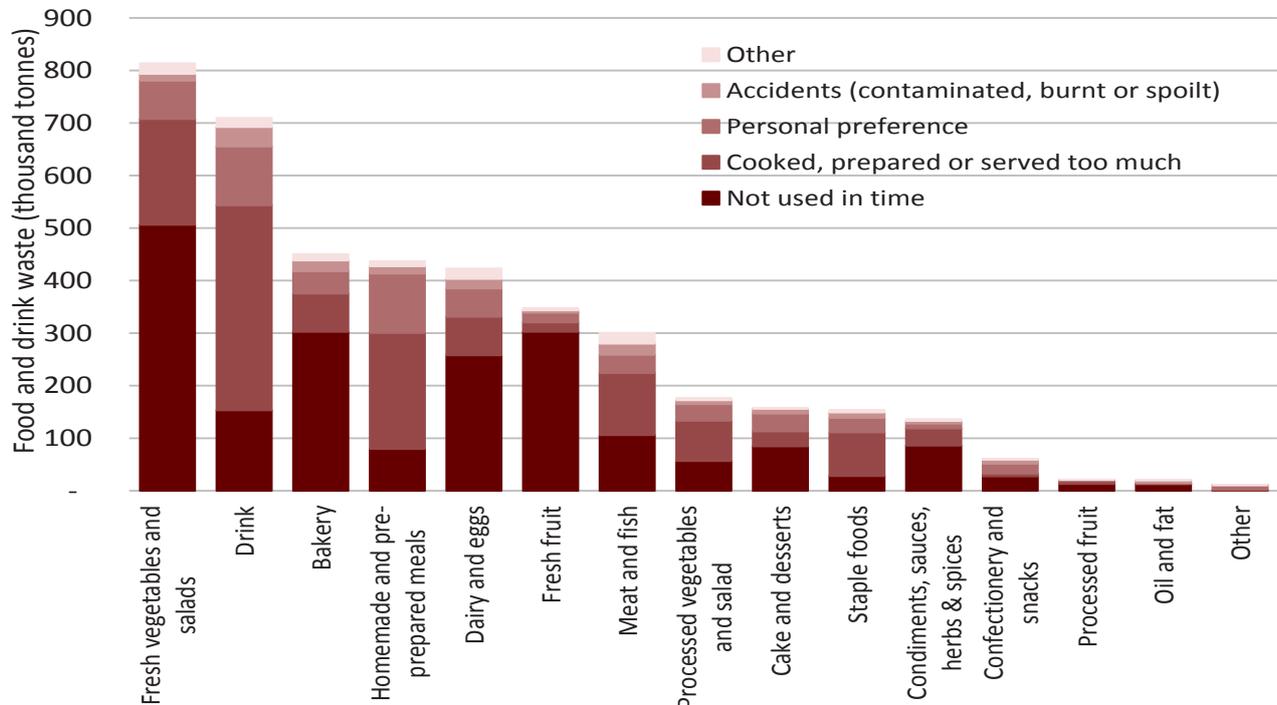

Source: *Waste arisings in the supply of food and drink to households in the UK, WRAP 2010.*

⁷ Including packaging from non-food and drink products sold in grocery shops.

5.7: UK avoidable household food and drink waste by food group and reason for disposal 2012

4.2 million tonnes of avoidable food waste⁸ was disposed of in 2012 by UK households, equivalent to 12% by weight of that brought into the home. 48% was not used in time, 32% was due to too much being cooked or served and 14% down to personal preference.

Of the 4.2 mt of avoidable food waste, 19% was fresh vegetables and salad and 17% was drink. 2 mt of food wasn't used in time. 25% was fresh vegetables and salad and fresh fruit and bakery each made up 15%.

1.3 mt of food was wasted because too much food was cooked or served. Nearly a third was drink, homemade and pre-prepared meals was 17% and fresh vegetables and salad was 15%. Over 0.3 mt of fresh fruit was wasted, 87% of which was not used in time. Over half of drinks, homemade and pre-prepared meals and staple food were wasted due to too much being cooked or served.

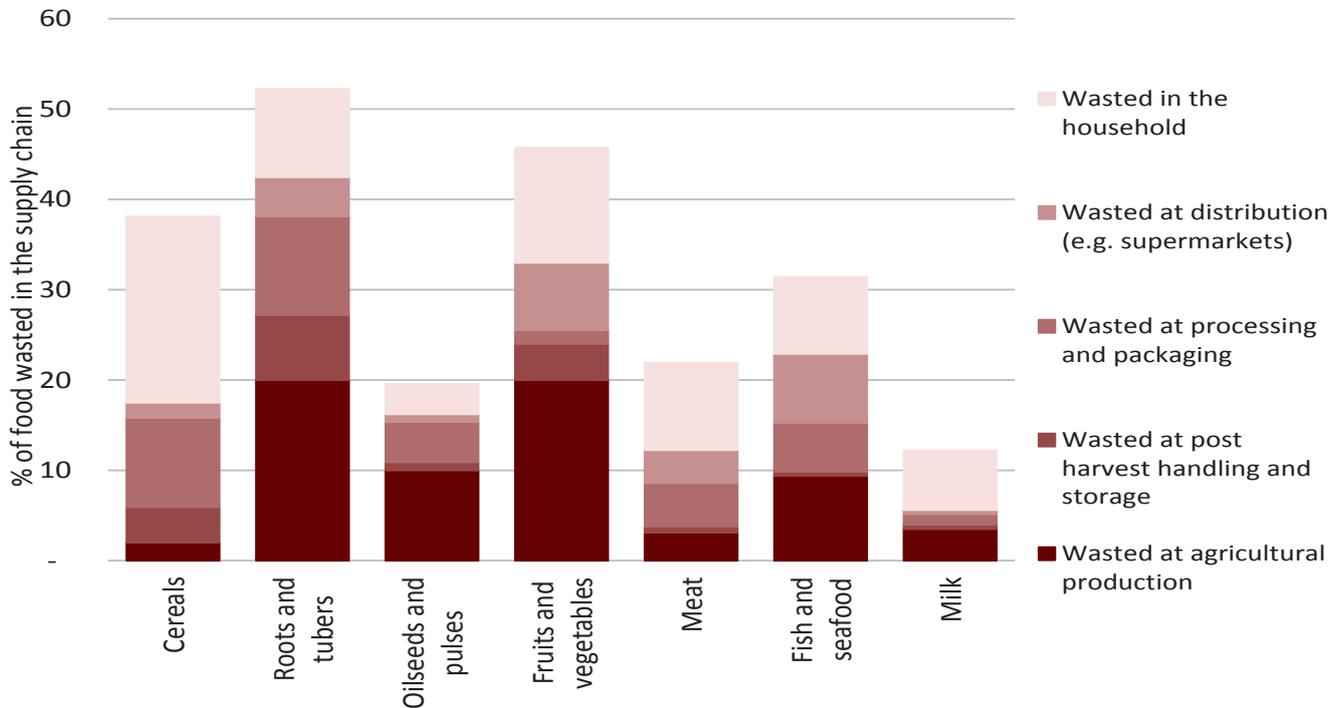

Source: *Household Food and Drink Waste in the United Kingdom, WRAP 2012.*

⁸ Food waste refers to food and drink waste brought into the home, not eaten out.

5.8: Food wasted at each stage of the supply chain⁹ in Europe and Russia, 2010

Roots and tubers and fruit and vegetables had the most wasted throughout the supply chain with 52% and 46% respectively. Both also had by far the highest waste at agricultural production at 20%. Only 12% of milk products was wasted in total.

Cereals contributed the most to food wasted in the household, with 21% not being consumed, while fruit and vegetables contributed the next most at 13%. Oilseeds and pulses only contributed 3%.

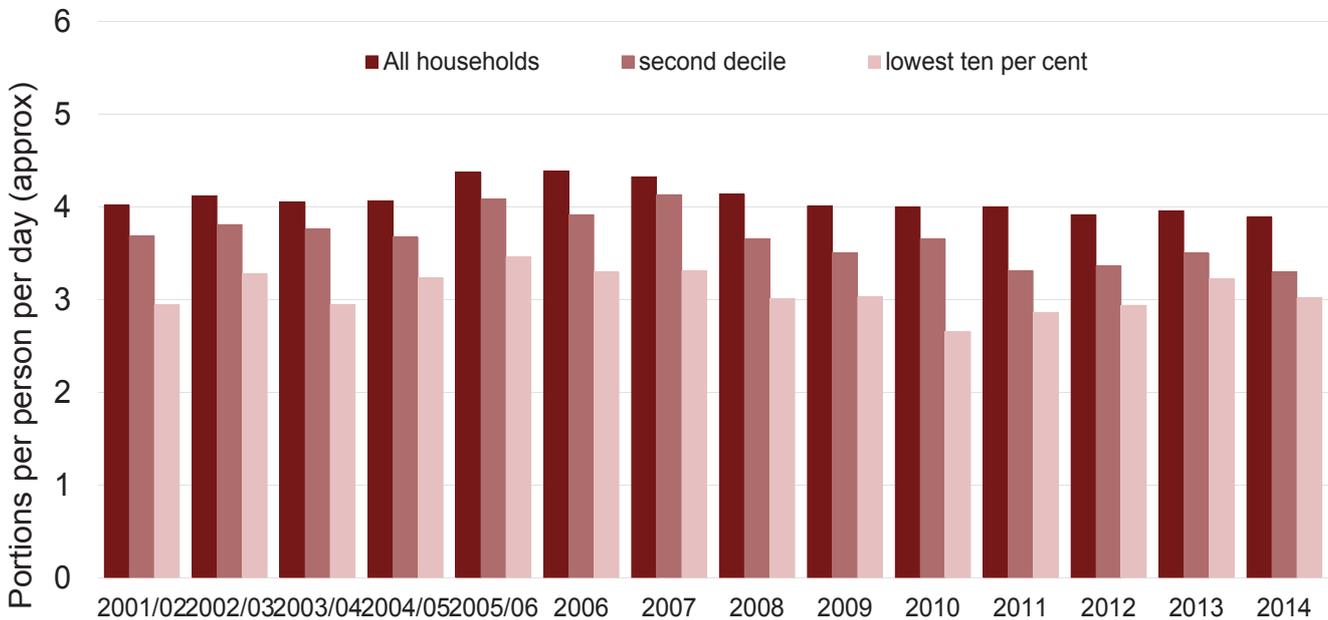

The three stages between agricultural production and the household were generally the least wasteful stages, with no food group wasting more than 11% at each stage.

Source: *Global Food Losses and Food Waste, 2011*

⁹ It is assumed that product that hasn't been wasted has been consumed.

6.1: UK trend in purchases of fruit and vegetables (excluding potatoes) to 2014

UK household purchases of fruit and vegetables were 1.8% lower in 2014 than in 2013, a reduction of 11.4% since their peak in 2006.

Purchases of 5 A DAY² across all households decreased to 3.9 portions after a increase in 2013 to an average of 4.0 portions.

The lowest income households³ purchase the least fruit and vegetables at an average of 3.0 portions per person of 5 A DAY in 2014, a decrease on 2013 at an average of 3.2 portions per person of 5 A DAY.

Households in the second decile had seen the greatest reduction in purchases of fruit and vegetables between 2007 and 2011 at 20%.

Defra estimates that 22% of edible fruit and vegetables are wasted⁴.

Source: *Family Food 2014, Defra, December 2015.*

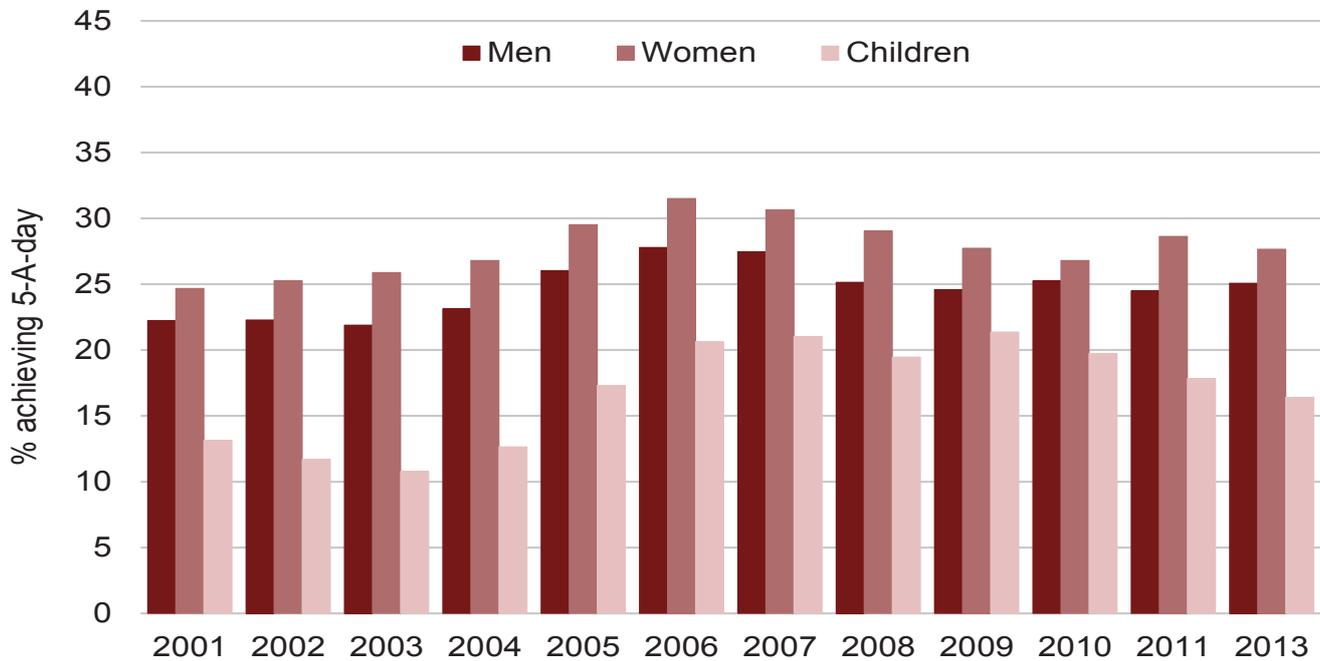

² 5 A DAY calculated as all purchases of fresh and processed fruit and vegetables including fruit juice divided by the adult portion size of 80 grams.

³ Lowest income households are those with incomes in the lowest ten per cent of all households. Data on low income households is available from 2001.

⁴ Household Food and Drink Waste linked to Food and Drink Purchases, Defra July 2010.

6.2 Trend in the consumption of fruit and vegetables in men, women and children in England to 2013⁵

In 2013 25% of men, 28% of women and 16% of children (aged 5 to 15 years) consumed the recommended 5 A DAY.

In 2013 16% of children achieved 5 A DAY, having been 18% in 2011, over 20% in 2007 and only 11% in 2003.

Achieving 5 A DAY peaked in 2006 with 32% of women and 28% of men achieving 5 A DAY.

In 2013 6.8% of adults and 6.7% of children included no fruit or vegetables in their diet. Those aged 65 to 74 eat the most fruit and vegetables.

Between 2011 and 2013 fruit and vegetable consumption by those aged 55 to 64 decreased to an average of 3.5 portions per day for men and 3.8 portions per day for women.

Source: *Health Survey for England, 2013, December 2014 (NHS Information Centre)*⁶

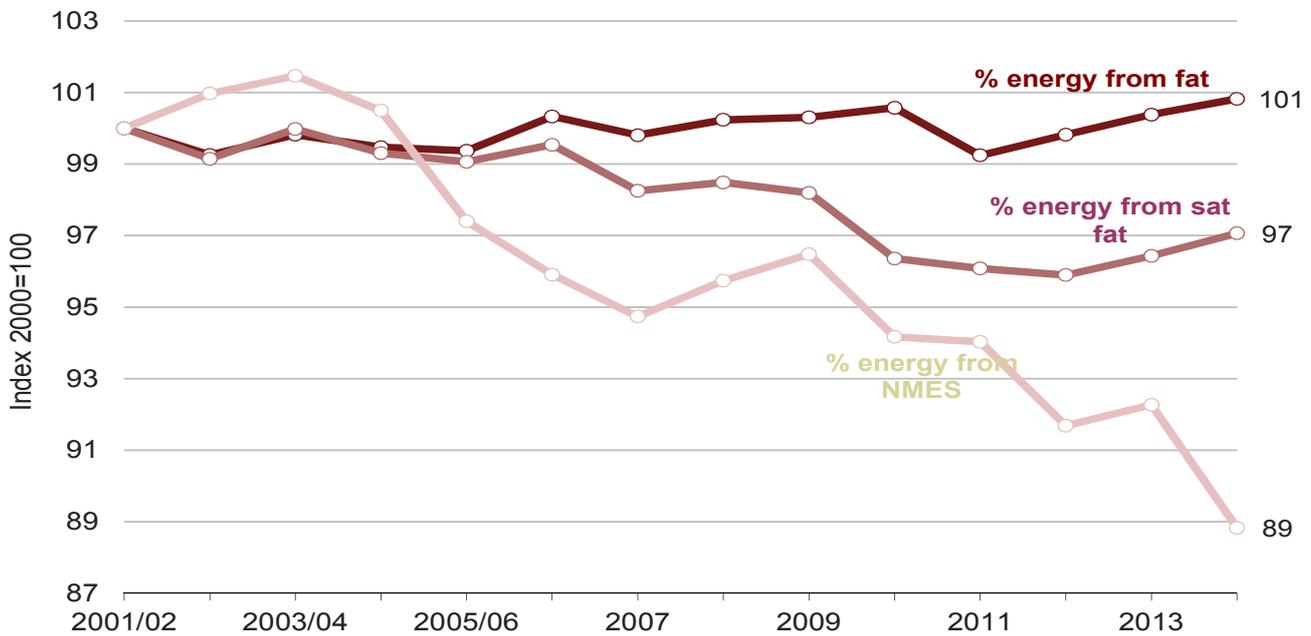

⁵ No data is available for 2012

⁶ Data from the Health Survey for England is weighted for non-response from 2003 onwards. Consumption is based on a 24 hour period.

6.3 UK trends in intakes of fat, saturated fatty acids and non-milk extrinsic sugars⁷ to 2014

Sodium intake continued on a downward trend to 2.62 g/person/day in 2014. This is 19% lower than in 2001-02, but above the SACN⁸ recommendation of 2.40g of sodium including table salt.

The percentage of food energy from NMES at 13.1% and from saturated fatty acids at 14.3% both exceed the SACN recommendation at 11% of total energy intake.

Total fat should contribute no more than 35%⁹ of food energy intake (excluding alcohol). Estimates based on food purchases in 2014 from the Family Food survey exceed this at 38.7%, virtually unchanged since 2001-02.

Source: *Family Food 2014, Defra, December 2015.*

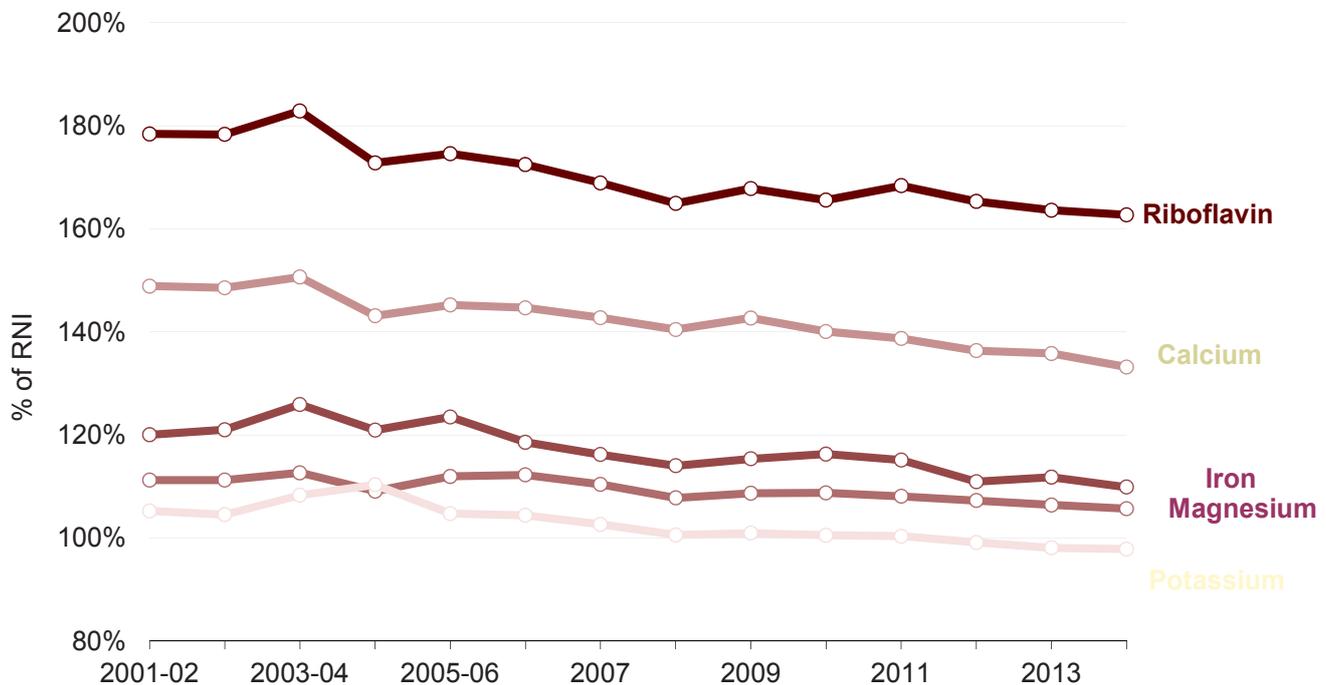

⁷ NMES - free sugar not bound in foods e.g table,sugar, honey and sugars in fruit juices, but excluding milk sugar.

⁸ Scientific Advisory Committee for Nutrition.

⁹ For recommended intakes see Dietary Reference Values for Food Energy and Nutrients in the United Kingdom, 1991 (Department of Health).

6.4: UK average micronutrient intakes, 2001-02 to 2014¹⁰

Based on food and drink purchases average micronutrient intakes except sodium¹¹ and potassium reached at least 100% of their reference nutrient intake value, where one is set, in 2014.

Intake of vitamin B12 has been consistently high since 2001-02 and remains at around four times the recommended level.

Over the four years 2011 to 2014, intakes of most vitamins and minerals showed downward trends, notably Vitamin B6 and folate, with decreases of 13% and 7.8% respectively. Over the same period, thiamin and vitamin C showed upward trends¹².

Source: *Family Food 2014*, Defra, December 2015.

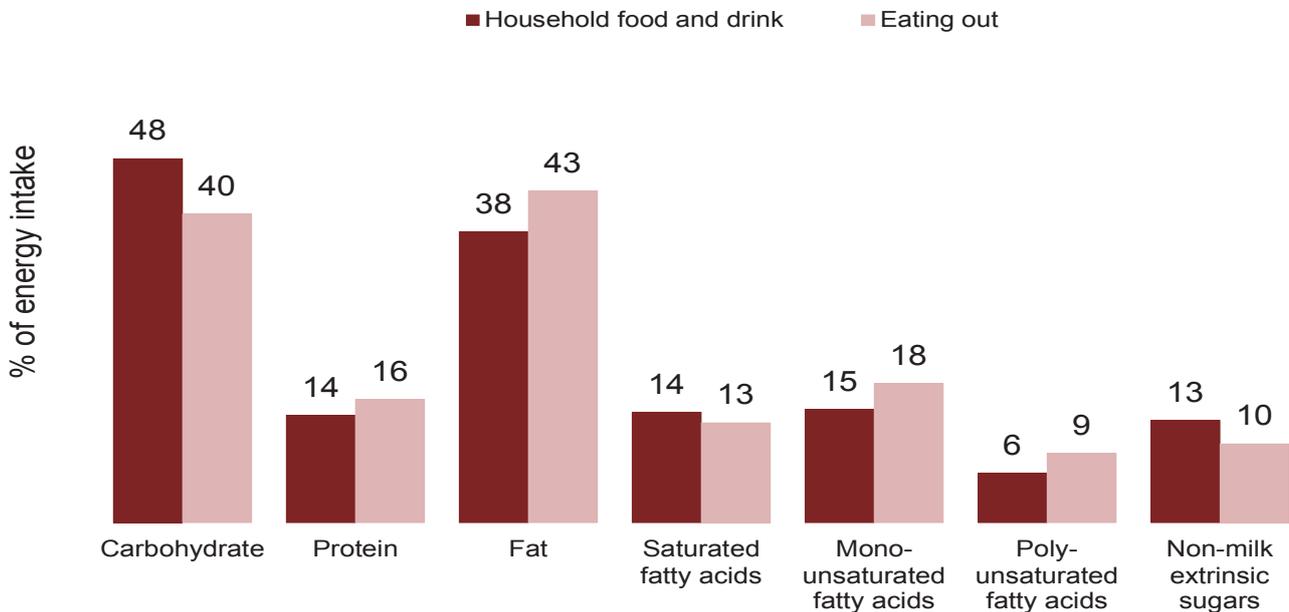

¹⁰ Reference Nutrient Intake: the intake which is considered sufficient to meet the requirements of 97.5% of the population.

¹¹ Guidance levels for sodium are a maximum daily amount.

¹² These trends are partly explained by changes in food composition data over time, due to new analytical data becoming available or changes in the formulation of food products.

6.5: The UK household diet compared with the eating out diet in 2014¹³

Eating out food and drink are products that are consumed before entering the household.

In 2013 eating out contributed 10.2% of energy intake excluding energy from alcohol.

The percentage of energy intake from eating out had fallen steadily from 12% in 2002-03 to 9.5% in 2012 but has risen in both 2013 and 2014 to 10.2%.

The eating out diet is higher in fat and protein but lower in carbohydrate and non-milk extrinsic sugars.

Mono-unsaturated and poly-unsaturated fatty acids are higher in the eating out diet. They are found in olive oils, rapeseed oil, vegetable oils, fish oils, nuts, milk and some meat and meat products.

Saturated fatty acids are slightly lower in the eating out diet. They are found in milk and dairy products, meat and meat products, biscuits, cakes and pastries.

Source: *Family Food 2014, Defra, December 2015.*

¹³ For recommended intakes see Dietary Reference Values (DRV's) for Food Energy and Nutrients in the United Kingdom, 1991 (Department of Health).

6.6: Trends in average energy intake from food and drink to 2014

Care needs to be taken when interpreting long term energy intake estimates, as there is evidence that under reporting of food consumption in the surveys which measure it has increased in recent times. The 2016 *Counting Calories* report from the Behavioural Insights team addresses this in some detail. Nevertheless, this data is the only long term assessment of intake available.

Average energy intake based on all food and drink purchases fell 2.3% to 2,142 kcal per day in 2014. Average energy intake based on all food and drink purchases has fallen 11.1% between 2001-02 and 2014. Energy intake from food and drink recorded as eating out rose 2.9% in 2014 but has fallen by 27% since 2001-02.

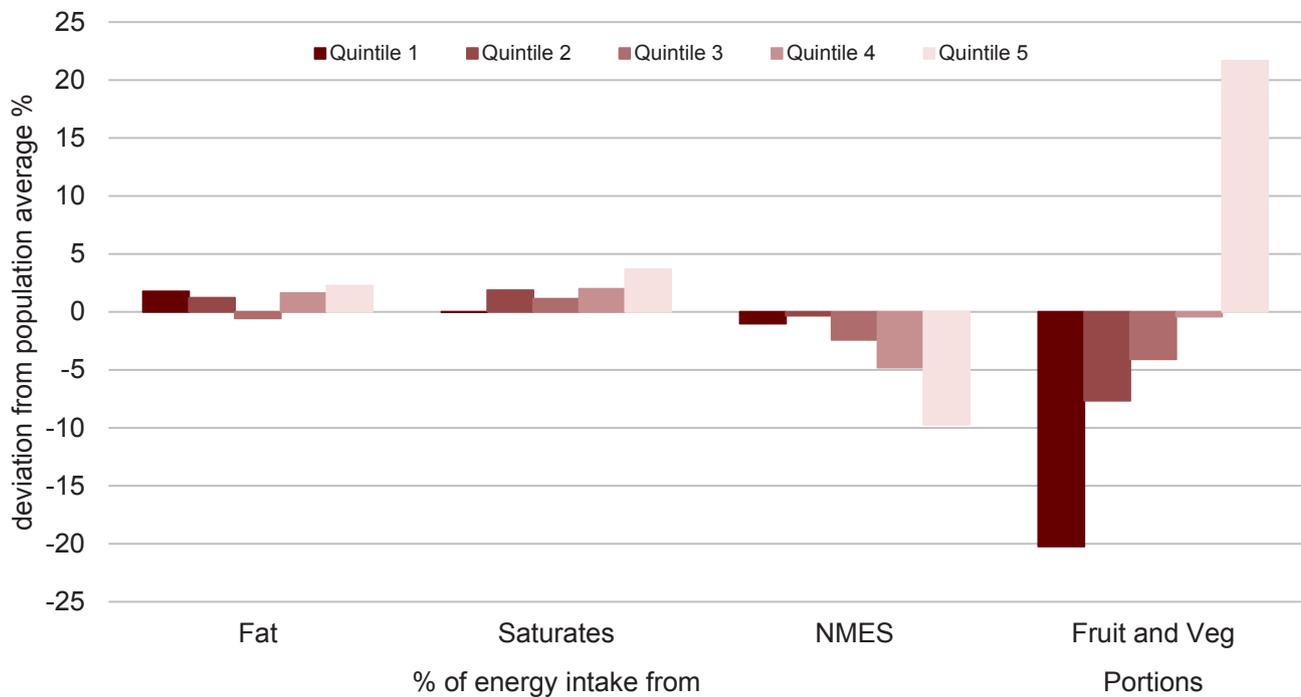

There is a long term downward trend in energy intake since the early sixties (visible in all components of the chart). Combining year on year changes of estimates on like bases suggests that average energy intake per person is 33% lower in 2014 than in 1974.

Lowest income decile households purchased 5.5% less food for the household than the UK average in 2014, when measured by energy content.

Source: *Family Food 2014*, Defra, December 2015.

6.7: UK dietary indicators by equivalised income¹⁴

The percentage of food energy derived from total fat does not vary much with income.

Food energy derived from saturated fatty acids is 3.7% higher in quintile 5 than quintile 1.

The percentage of food energy obtained from NMES¹⁵ tends to fall when income rises. Quintile 5 is 8.8% lower than quintile 1.

Fruit and vegetable purchases rise strongly with income, 52% more being purchased in the highest income quintile compared to the lowest in 2014.

In 2014 the highest income quintile purchased an average of 4.8 portions of fruit and vegetables per day. The lowest income quintile purchased 3.2 portions per day. (See Chart 6.2 for trends). The average across all households is 3.9 portions per day.

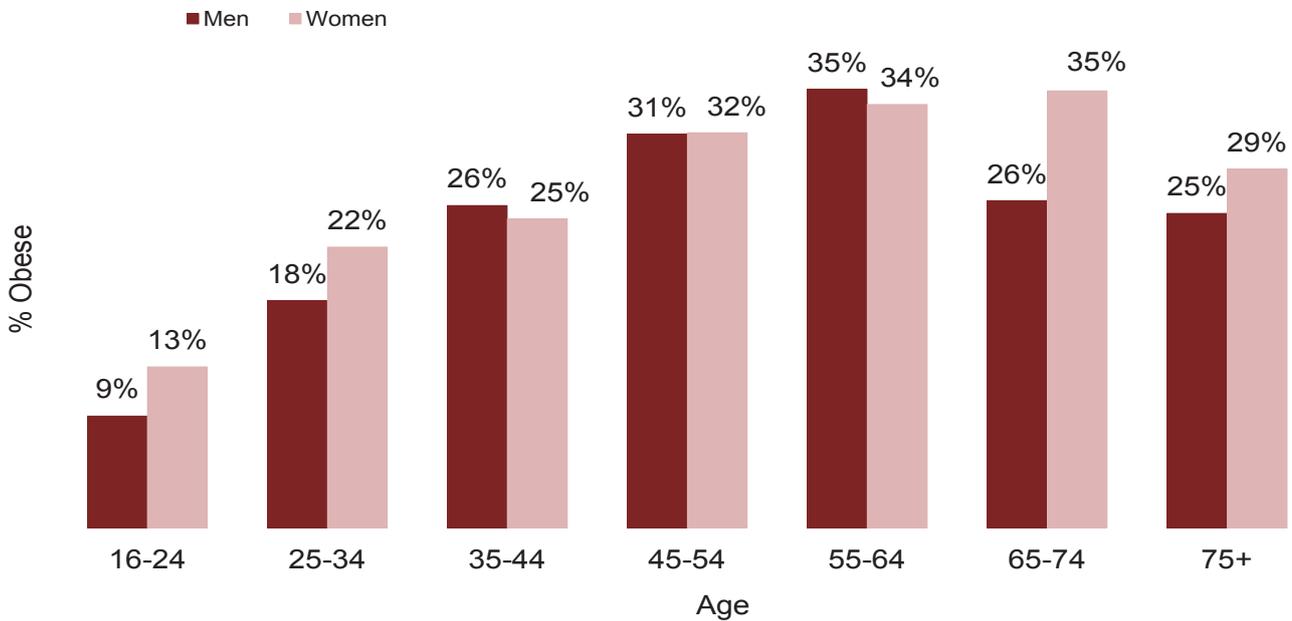

Source: *Family Food 2014*, Defra, December 2015.

¹⁴ Household income adjusted for size and composition using the OECD scale

¹⁵ NMES – free sugar not bound in foods e.g. table sugar, honey and sugars in fruit juices, but excluding milk sugar.

6.8: Levels of adult obesity in England¹⁵

Health problems associated with being overweight or obese are estimated to cost the NHS around £5bn per year. Obesity is associated with cardiovascular risk and with cancer, disability during old age, decreased life expectancy and serious chronic conditions such as Type 2 diabetes, osteoarthritis and hypertension.

In 2014 26% of adults were obese and a further 36% were overweight.

The obesity rate across all men was 24% in 2014, having decreased slightly on 2013. The percentage of overweight (including obese) men was 65% in 2013, decreased slightly on 2013. The obesity rate in men aged 65-74 increased 19% in 2014 but fell 5.8% in men aged 55-64.

The obesity rate across all women was 27% in 2014. The obesity rate in women aged 25-34 decreased 19% in 2014.

The OECD¹⁶ reported in 2011 that the prevalence of overweight and obesity in adults exceeds 50% in 19 of 34 OECD countries.

Source: *Health Survey for England 2014, December 2015 (NHS Information Centre)*.

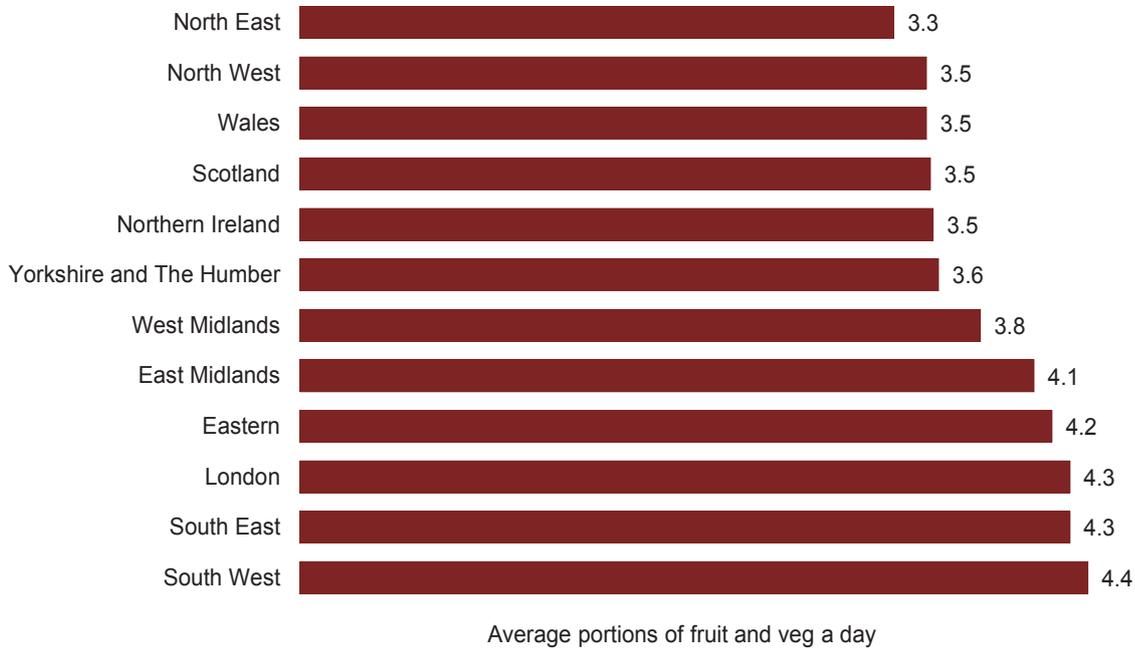

¹⁵ Body Mass Index (BMI) is a measure of weight relative to height: underweight = less than 18.5kg/m², normal = 18.5 to less than 25kg/m², overweight = 25 to less than 30kg/m², obese = 30kg/m² or more (includes morbidly obese), morbidly obese = 40kg/m² or more.

¹⁶ The Organisation for Economic Co-operation and Development: Health at a Glance 2011-2018.

6.9: UK Regional household consumption of fruit and vegetables, 2012-2014¹⁷

Within England, household purchases of both fruit and vegetables were lowest in the North East.

Northern Ireland, Scotland and Wales all had the same combined total purchases of fruit and vegetables (excluding potatoes) at 3.5 portions per person per day. Purchases of fruit were lowest in Wales.

Much of the regional variation may be explained by differences in income. In general, purchases of fruit and vegetables increase with income (see Chart 6.9).

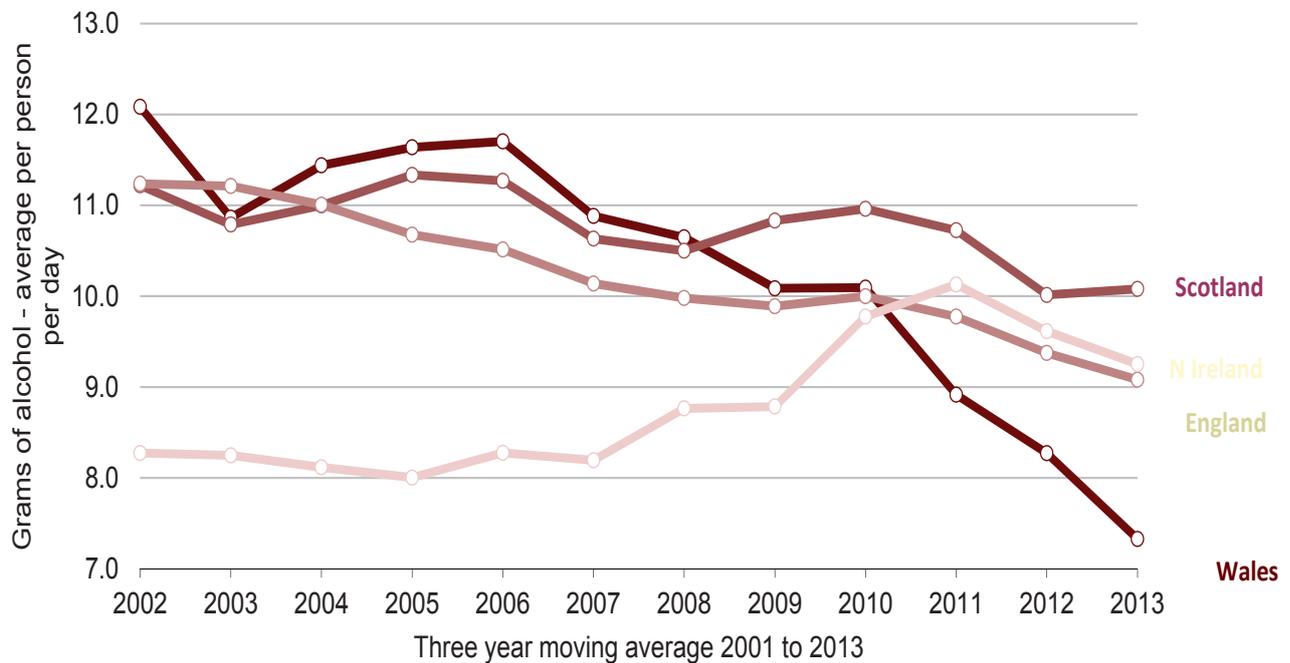

Waste and inedible content are not taken into account here. See Chart 6.3 for trends over time and Chart 5.2 for estimates of edible household waste.

Source: *Family Food 2014, Defra, December 2015.*

¹⁷ 5 A DAY calculated as all purchases of fresh and processed fruit and vegetables including fruit juice divided by the adult portion size of 80 grams

6.10: UK Trend¹⁸ in average alcohol intake (including eating out)

Averaged across 2012 to 2014, alcohol intake per person fell in all UK countries, except Scotland with Wales showing the greatest reduction at 11% to 7.3 grams/person/day.

Over the last 10 years alcohol intake has been on a downward trend in England and Wales. In Scotland intake has fluctuated but is little changed, whilst in Northern Ireland intake has increased by 12% over the same period, although has decreased 4% most recently.

Within England in 2014, average alcohol intake was highest in the North West, average alcohol intake was the lowest in London.

In Scotland in 2014, over 80% of alcohol intake was from household purchases.

The Department of Health is responsible for Government health policy on alcohol misuse. Regularly drinking above the recommended daily limits significantly increases the risk of ill health.

Source: *Family Food 2014*, Defra, December 2015.

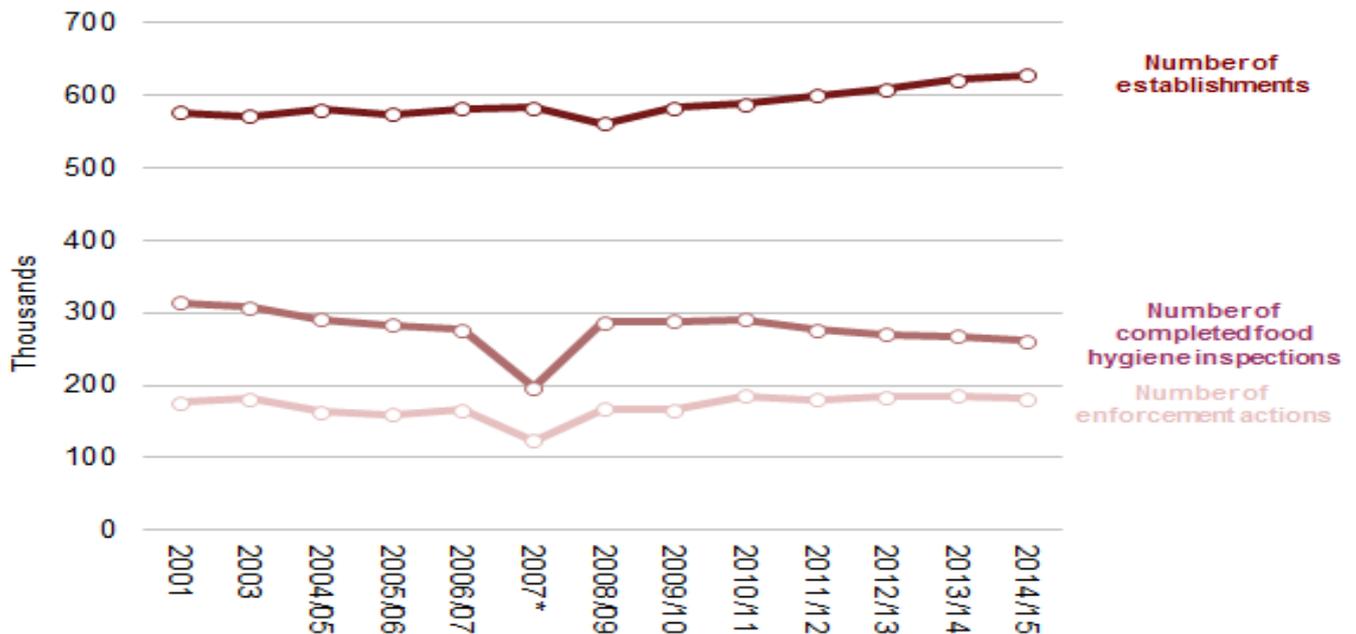

¹⁸ Three year moving average, 2012 to 2014

7 Safety and Confidence

7.1: UK Inspections and enforcement actions of food businesses to 2014-15

* 2007 data is for 9 months only

The 434 UK Local Authorities (LAs) are responsible for inspections and enforcement of food hygiene and food standards legislation. Submitted returns are monitored, audited and reported on by FSA.

There were 627,425 food establishments under LA control at 31 March 2015, 0.9% up on 2013-14.

520,352 interventions were carried out by LAs in 2014-15 (402,475 food hygiene and 117,877 food standards), a decrease of 0.8% on the reported number carried out in 2013-14 (524,491).

181,877 formal enforcement actions were carried out in 2014-15, an overall decrease of 1.9% from 2013-14 (185,385). 4.9% of establishments were not yet risk rated in 2014-15, an improvement on 5.6% in 2013-14.

The proportion of rated establishments achieving ‘broad compliance’¹ increased from 91.7% to 93.0%.

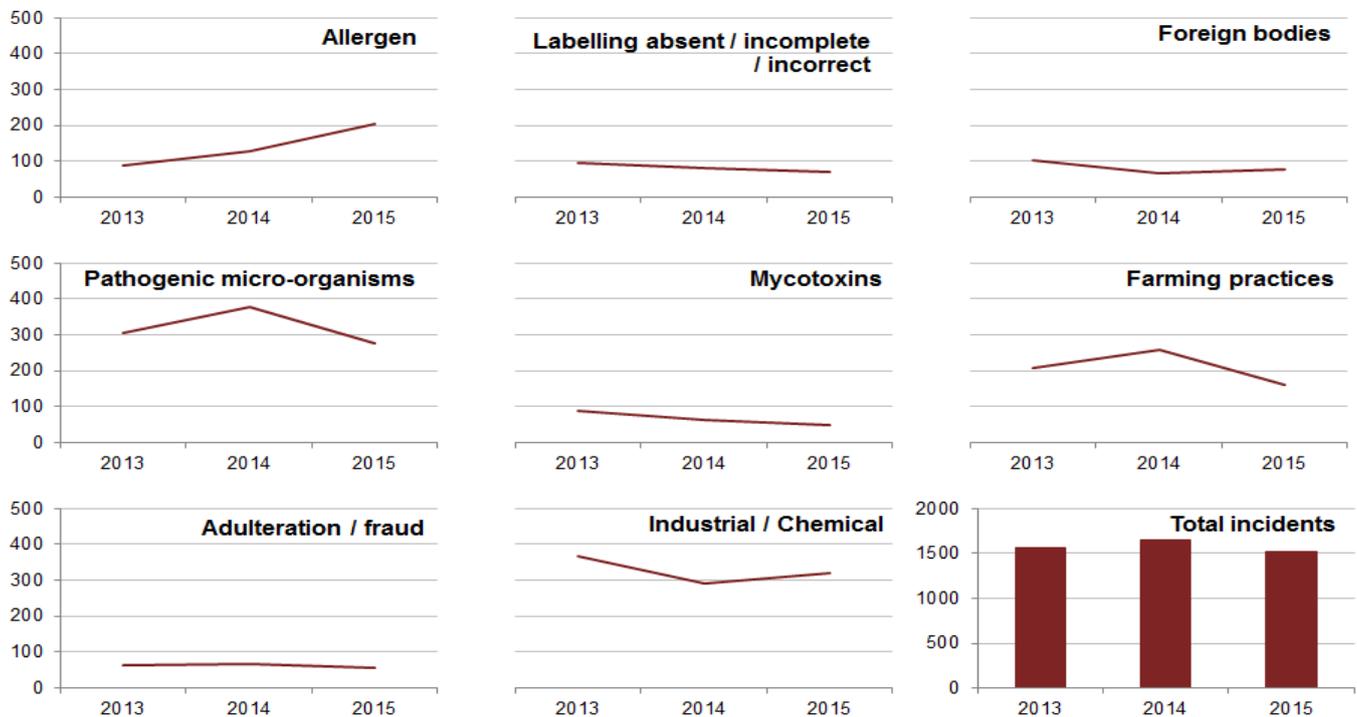

Source: Food Standards Agency Board report on monitoring of food law enforcement activity, 2014-15.

¹ LAs assess compliance in accordance with statutory guidance set out in the Food Law Codes of Practice for England, Wales and Northern Ireland at www.food.gov.uk/enforcement/codes-of-practice/food-law-code-of-practice-2015 and for Scotland at www.foodstandards.gov.scot/food-law-code-practice-2015. Scores are given for three compliance criteria: hygiene; structure; and confidence in management. Businesses that score not more than 10 under each of these three criteria are defined as ‘broadly compliant’. This is equivalent food hygiene ratings of 3 to 5 under the Food Hygiene Rating Scheme operating in England, Wales and Northern Ireland.

7.2: Contamination incidents investigated by the Food Standards Agency (FSA) by RASFF category², UK 2013-2015

In 2015, the Food Standards Agency and Food Standards Scotland were notified of and investigated 1,514 foods, feed and environmental contamination incidents in the UK. The overall number of incidents was similar to those seen in recent years. However, in most categories, the numbers of incidents differ considerably from year to year.

In 2015, 67% of the pathogenic micro-organism incidents were related to either *Salmonella* species or *Escherichia coli*. However, 49 of the 75 *E. coli* incidents resulted from shellfish bed monitoring. There are many different types of *E. coli*. Some live harmlessly in the intestines of humans and animals, whereas pathogenic strains can cause illness if contaminated food is consumed. High counts of *E. coli* can signify a risk that faecal pathogens are present and are used as an indicator of poor hygiene conditions but are not necessarily harmful.

In 2015, fires were the cause of almost all chemical contamination (other) incidents. The number of allergen incidents has increased from 89 in 2013 to 206 in 2015. This may be related to new rules on providing allergen ingredients information from December 2014.

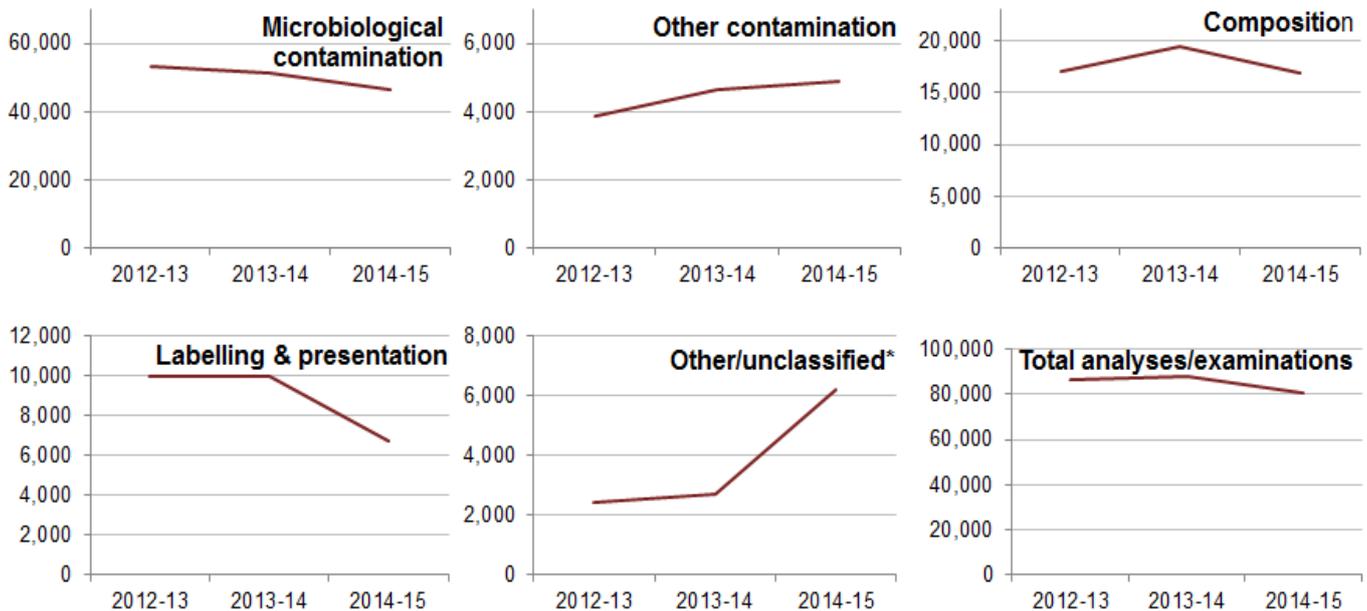

Following a change in reporting procedures, the frequency of veterinary medicine incidents in 2014 and 2015 is much higher than in 2013. This is due to more notifications from on-going surveillance programmes since late 2013.

Source: *Annual Report of Incidents, 2015 (FSA)*.

² Rapid Alert System for Food and Feed (RASFF) categorisation is used for notifications to the European Commission. The long time series data in the 2014 Pocketbook is no longer available.

7.3: Analyses/examinations carried out on official samples

* In 2014-15 in 3,458 cases the analysis type could not be mapped to the LAEMS analysis type and these samples have been added to the "Other/unclassified" category.

Official samples are those analysed/tested by official control laboratories. The FSA Local Authority Enforcement Monitoring System (LAEMS) collects data on official samples.

A total of 68,471 official food samples were reported to have been taken in 2014/15, a decrease of 9.5% from 2013/14 (75,667). The total numbers of samples for Northern Ireland are based on the summary of samples reported on UKFSS by authorities in 2014/15, but were not checked at LA level due to the changes in authorities in Northern Ireland during the past year.

Since last year there has been a reduction for most types of analysis/tests. The rise in overall sample numbers and in compositional analysis in 2013/14 may have been a reflection of the increased activity in monitoring food fraud following the horse meat incident, and the decline over the past year, a relaxation in this activity.

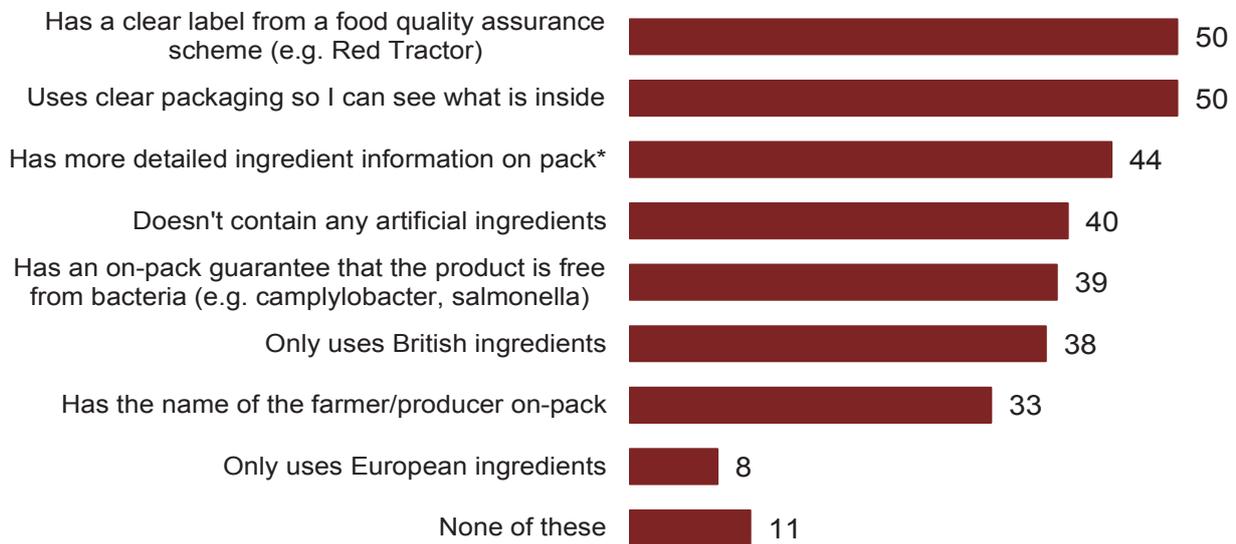

Those Local Authorities that record their food samples on the UK Food Surveillance System (UKFSS) have the option to provide their sampling return from that system. There continued to be issues with extracting data from UKFSS on the analyses carried out on some samples. The figures provided may therefore be subject to under-reporting.

7.4: Factors that would make people trust food and drink companies/brands more, March 2015

* eg where ingredients are sourced, how the ingredient is used

EU regulation requires that country of origin details be provided for various food products, primarily unprocessed meat and fruit and vegetables. The country of origin must also be provided 'whenever its absence is likely to mislead consumers as to the true country of origin'.

Reflecting this and a voluntary initiative by Food and Drink Federation members, fresh meat, poultry and fish now carry origin details, highlighting a British provenance when applicable. Referencing British origin is clearly worth doing as 38% of people say only using British ingredients encourages their trust in a product. This falls to 8% for European ingredients.

While the experiences of for example Weetabix and Hovis show that commitment to British ingredients can pose challenges in the event of poor crops, highlighting such ingredients where they are present should benefit operators.

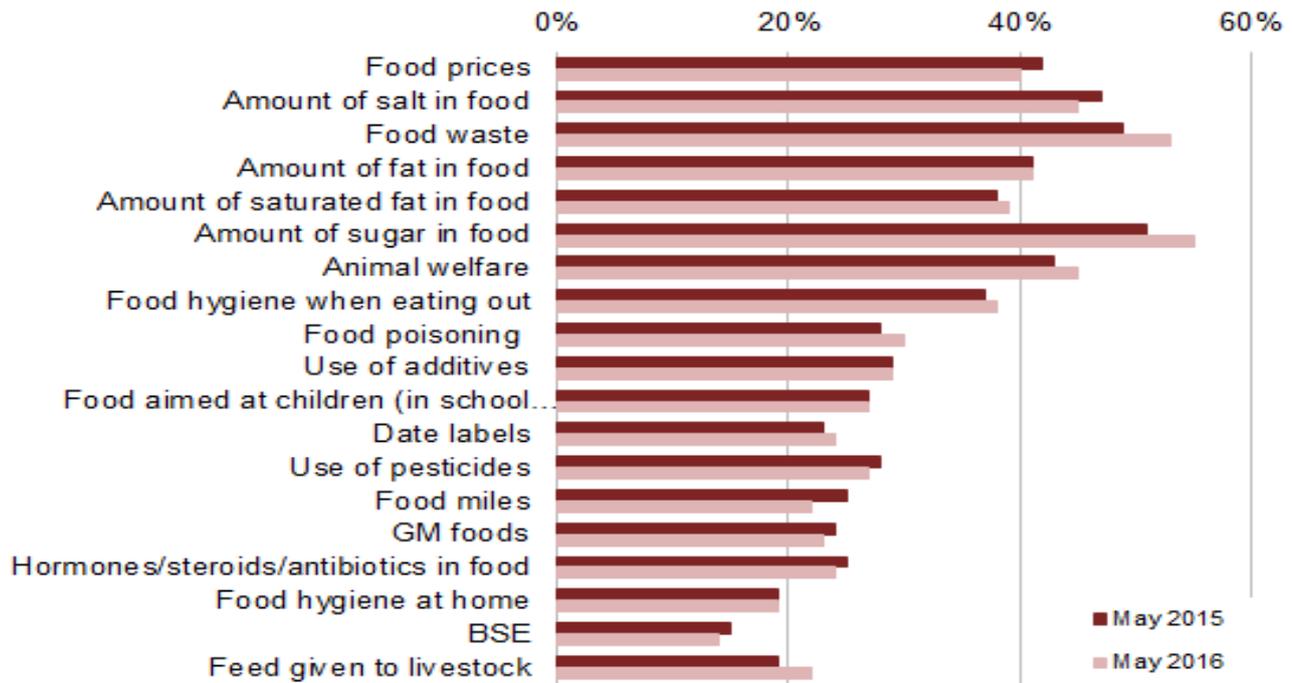

However, nearly half of British consumers say that more detailed ingredient information, such as the origin or how it is used, on-pack would encourage them to trust a food/drink company or brand more. This suggests significant scope for operators to build trust among consumers by providing more information on ingredients, where they come from and why they are used.

7.5: Percentage of people concerned about certain food issues, 2015-16

The main food issue of concern to people is the amount of sugar in food, with 55% concerned in May 2016, an increase from 51% in May 2015. Food waste was the second highest concern to people, at 53%. Year on year food prices fell for the first time since 2006 in the year to May 2014 and food prices were below general inflation during the period of the survey.

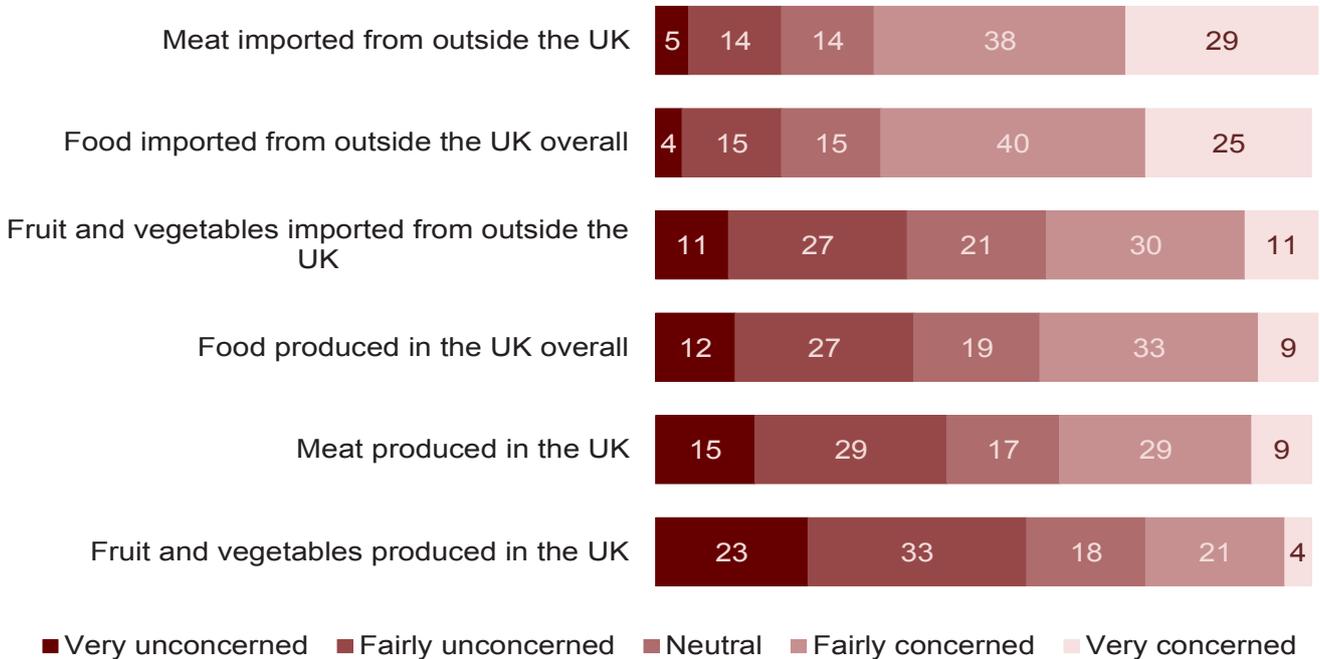

Most food issues show an unchanged or lower level of concern than the previous year. Notable exceptions to this were concerns about sugar, animal welfare, pesticides, and GM in foods.

Food prices, salt, sugar, fat, waste and animal welfare are the issues where more than 40% of people are concerned. In May 2016 83% of respondents reported concerns over food safety.

Source: *Biannual public attitudes tracker (FSA) May 2016*

7.6: Percentage of people concerned about where food is produced

Food safety in imported products, in particular meat from outside the UK, caused the most concern for respondents⁶.

67% of survey respondents expressed concern about imported meat compared to 62% in 2012, of which 29% were very concerned (24% in 2012). This compared with 9% being very concerned and 29% showing some concern for meat produced in the UK.

39% of respondents were unconcerned about food produced in the UK, although 27% were fairly concerned.

The safety of fruit and vegetables produced in the UK concerned the least number of respondents with only 4% being very concerned, whilst 74% expressed either no concern or no opinion.

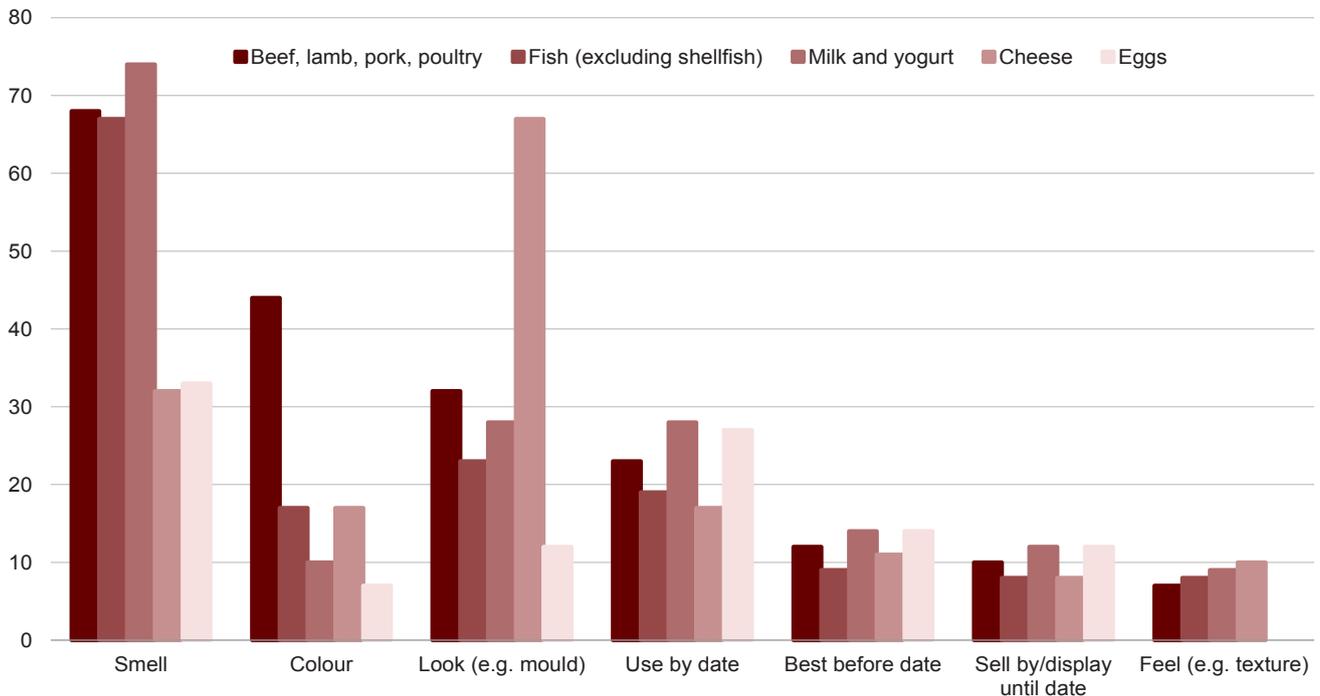

Source: *Food and You Survey 2014*⁷, (FSA).

⁶ Survey sample was a stratified, clustered random probability sample of private UK Households.

⁷ This survey was carried out during 2014; although there were changes to the survey questions in 2014, it is possible that these results have been influenced by the horsemeat fraud activity in early 2013.

7.7: Methods used to assess whether food is safe to eat

FSA guidance is that even if a food looks and smells fine, the use by date is the best indicator of whether it is safe to eat. In 2012, use by dates tended to be the second, third or fourth most commonly reported method of indicating food safety.

How food smelled was the method used by between 68% and 74% of respondents to indicate whether meat, fish, milk and yogurt were safe to eat.

How food looks e.g. the appearance of mould, was the most common practice for assessing whether cheese is safe to eat.

Smell and use by dates were the two most common methods used for assessing the safety of eggs, but 19% of respondents said that their preferred method was whether the eggs floated in water.

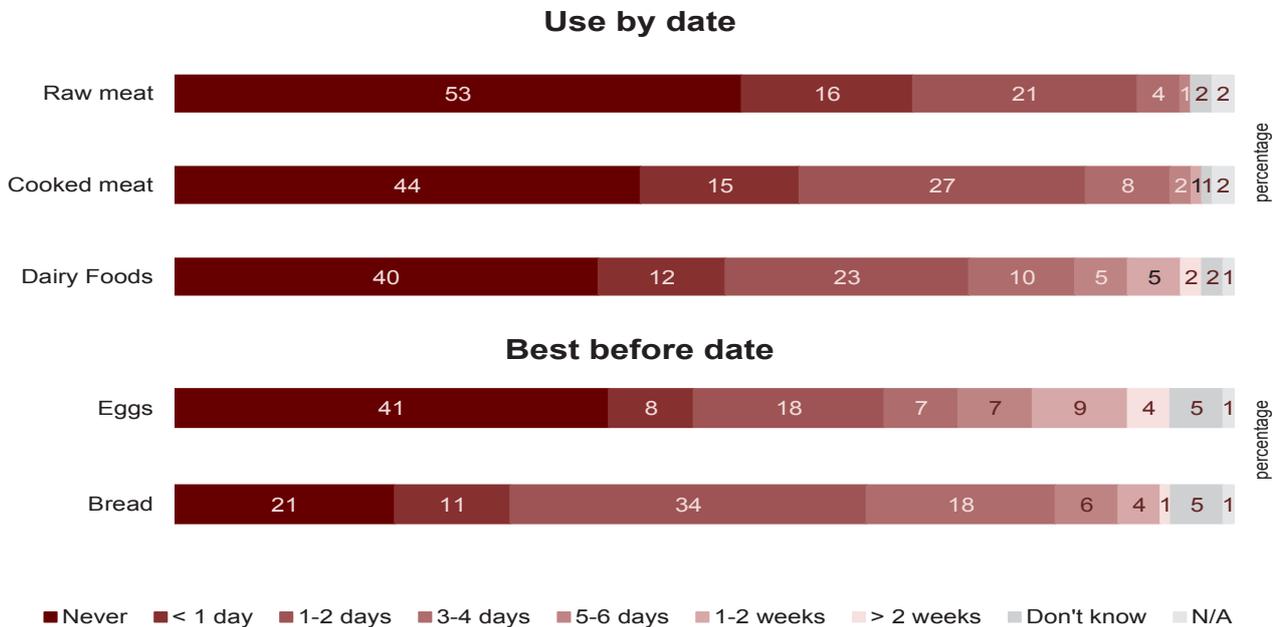

Promoting food safety and protecting public health are central strategic objectives of the Food Standards Agency (FSA).

Source: *Food and You Survey 2014*⁸, FSA

⁸ Survey sample was a stratified, clustered random probability sample of private UK Households.

7.8: Maximum time after use by date / best before date that respondents would eat / use food

The FSA recommends that foods should be consumed before the specified use by date as it could be dangerous to eat food after this, even though it might look and smell fine.⁹

When asked about bread and eggs, respondents were more likely to report that they would eat them for longer after the recommended date, compared with any other food asked about. For example 28% and 26% of respondents said they would eat bread and eggs (respectively) three days or more after the best before date.

Twenty-two per cent of respondents said they would eat dairy products three days or more after the use by date. Respondents were less likely to report that they would eat meat for longer after the recommended date, compared with the other foods asked about. For example, 11% of respondents reported that they would eat cooked meat three days or more after the use by date, while six per cent said they would use raw meat three days or more after the use by date.

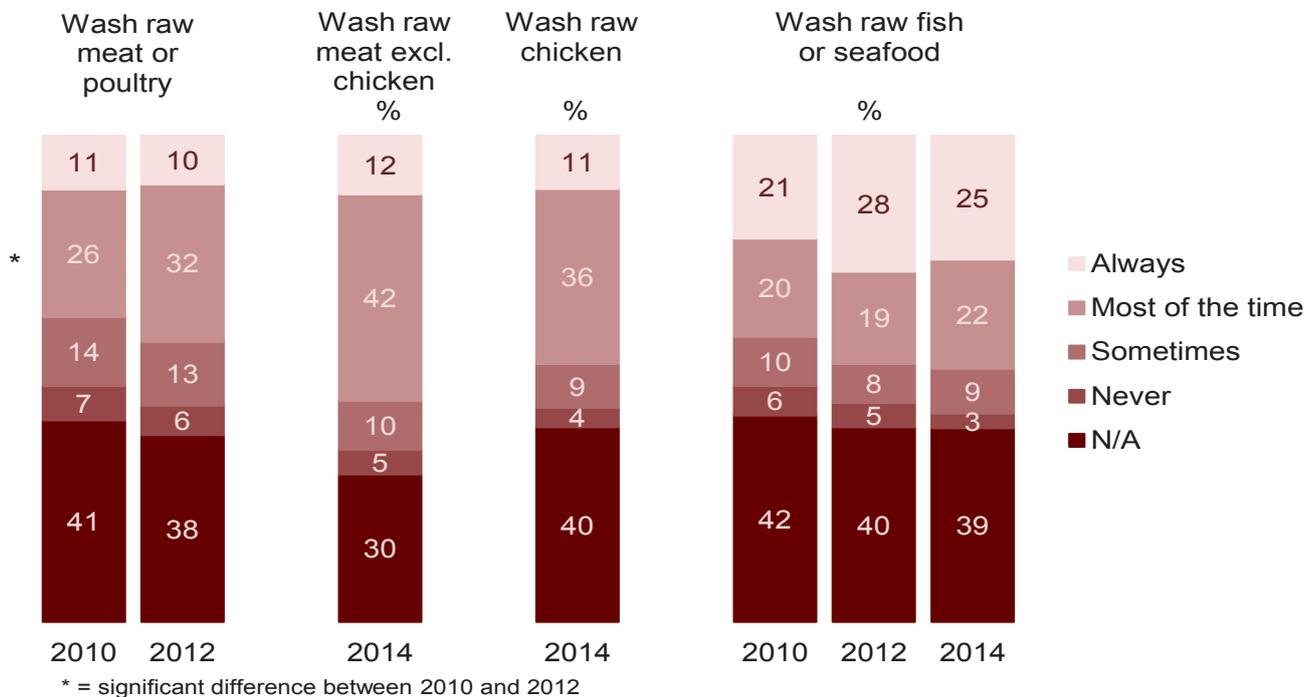

Some differences were observed at Wave 3 (2014) compared with findings at Wave 2 (2012). Respondents were more likely to report eating raw meat less than a day after the use by date (16% compared with 13% at Wave 2) and less likely to say they would eat it between one and two days after (21% compared with 24% at Wave 2). Respondents were less likely to say they would never eat eggs after the best before date (41% compared with 45% at Wave 2).

Source: *Food and You Survey 2014*, (FSA).

⁹ Although dairy foods were asked about with respect to 'use by' dates, current guidelines state that each dairy product should have a date mark which is appropriate for the specific product. Foods which are microbiologically highly perishable or likely to become an immediate danger to human health after a short period of time will have a use by date. Other products may have a best before date. Further detail of these guidelines can be found at the following link: https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/69316/pb132629-food-date-labelling-110915.pdf

7.9: Frequency of washing raw meat, fish or poultry¹⁰

The Food and You Survey has asked about food preparation practice in four waves over four years. Similar to findings at Waves 1 (2010) and 2(2012), 22% of respondents reported that they never washed raw fish or seafood when preparing and cooking it, while 53% reported that they did at least some of the time. Thirty nine per cent of Wave 3 (2014) respondents said they always washed raw fish or seafood.

Compared with washing fish and seafood, a higher proportion of respondents reported that they never washed raw meat or poultry. Changes to the question at Wave 3 to separate raw meat and poultry other than chicken from raw chicken make comparisons with Waves 1 and 2 difficult. Nevertheless there appeared to have been an increase in the proportion of respondents reporting that they never washed raw meat at Wave 3, particularly meat other than chicken. This follows a higher proportion of respondents reporting that they never washed raw meat or poultry at Wave 2 compared with at Wave 1 (32% compared with 26%).

Respondents were more likely to report washing chicken than other meats. Forty two per cent said they never washed meat other than chicken, with 46% reporting that they did so at least sometimes. Thirty six per cent of respondents said that they never washed chicken, but over half (53%) reported washing chicken at least sometimes.

Source: *Food and You Survey 2014, FSA*

¹⁰ The FSA recommends that raw meat and fish are not washed prior to cooking due to the risk of cross contamination from water splashing on the sink, surrounding surfaces, and utensils, which may come into contact with ready to eat food.

Economic Definition of food and agri-food sector

The UK food sector is defined as food manufacturing, food wholesaling, food retailing and non-residential catering. In terms of the standard industrial classification (SIC 2007) it is defined as:

Food Manufacturing:	10 + 11
Food Wholesaling:	46.3 (excluding 46.35) + 46.17
Food Retailing:	47.2 (excluding 47.26) + 47.11 + 47.81
Non-residential Catering:	56

The deductions are to remove non-food items as far as possible.

The agri-food sector is the food sector plus agriculture and fishing. Agriculture and fishing are shown in several charts for comparison.

Net capital expenditure

This is calculated by adding to the value of new building work, acquisitions less disposals of land and existing buildings, vehicles and plant and machinery.

Gross Value Added (GVA)

GVA is the difference between output and intermediate consumption for any given sector / industry. This is the difference between the value of goods and services produced and the cost of raw materials and other inputs which are used up in production.

Total Factor Productivity (TFP)

Productivity measures the efficiency at which inputs are converted into outputs. Total Factor Productivity provides a comprehensive picture of growth.

Low income

The most commonly used threshold to determine relative low income is having an income which is less than 60% of the median in that year.

Absolute low income is considered to be having an income which is less than 60% of the median in that year, adjusted by the inflation level of (currently) 2013-14.

Equivalentised income

The income a household needs to attain a given standard of living will depend on its size and composition. Equivalentisation is a means of adjusting a household's income for size and composition so that the incomes of all households are on a comparable basis.

Small and Medium Enterprises (SMEs)

Outside of these statistics, the definition of a SME can depend upon several factors, including turnover. For these statistics, a 'small' business is a private sector business with fewer than 50 employees. A 'medium' business is a private sector business with between 50 and 249 employees.

A 'micro' business is a private sector business with between 1 and 10 employees, which, for the purpose of these statistics is incorporated within the 'small' category.
