Density of fast food outlets in England

In this analysis ‘fast food’ refers to food that is available quickly, therefore it covers a range of outlets that include, but are not limited to, burger bars, kebab and chip shops and sandwich shops. The density of fast food outlets in local authorities varies across England. The map (overleaf) shows the number of outlets for every 100,000 people resident in the local authority.

The density of fast food outlets in local authorities ranges from 24 to 199 per 100,000 population. Most fast food outlets are independent companies with only one or two outlets.

There is a growing body of evidence on the association between exposure to fast food outlets and obesity, however some studies show conflicting results.

There is strong evidence linking the availability of fast food outlets and increasing level of area deprivation.

Counts of outlets and rates per 100,000 population for each local authority, counts of outlets for wards and links to further reading are provided in the accompanying Excel spreadsheet.

Please note that the fast food data presented here has a number of limitations and these should be considered when interpreting the data. Details of these limitations can be found in the accompanying Excel spreadsheet.

Relationship between density of fast food outlets and deprivation by local authority

This chart illustrates the association between density of fast food outlets and area level deprivation.

The local authorities with a higher deprivation score (i.e. more deprived) have a greater density of fast food outlets.

Evidence from health survey data shows that the prevalence of overweight and obesity also rises with deprivation and fruit and vegetable consumption falls with deprivation.
