

Assessing new nuclear power station designs

Generic design assessment of Hitachi-GE's Advanced Boiling Water Reactor

Assessment report - AR02 Strategic waste management

December 2017

The Environment Agency protects and improves the environment.

We help people and wildlife adapt to climate change and reduce its impacts, including flooding, drought, sea level rise and coastal erosion.

We improve the quality of our water, land and air by tackling pollution. We work with businesses to help them comply with environmental regulations. A healthy and diverse environment enhances people's lives and contributes to economic growth.

We can't do this alone. We work as part of the Defra group (Department for Environment, Food & Rural Affairs), with the rest of government, local councils, businesses, civil society groups and local communities to create a better place for people and wildlife.

Natural Resources Wales is the largest Welsh government sponsored body. We were formed in April 2013, largely taking over the functions of the Countryside Council for Wales, Forestry Commission Wales and the Environment Agency in Wales, as well as certain Welsh government functions.

Natural Resources Wales' purpose is to pursue sustainable management of natural resources in all of our work.

Natural Resources Wales brings together the skills and expertise needed to ensure that we can operate effectively across our wide range of roles from adviser, facilitator, regulator and designator, to incident responder, partner and operator.

Executive summary

Protective status	This document contains no sensitive nuclear information or commercially confidential information.
Process and Information Document¹	The following sections of Table 1 in our process and information document (P&ID) are relevant to this assessment: Item 4: specifically 'Identification of the strategic considerations with respect to radioactive waste management which underpin the design.'
Radioactive Substances Regulation Environmental Principles²	The following principles are relevant to this assessment: RSMDP1 - Radioactive substances strategy RSMDP3 - Use of BAT to minimise waste DEDP1 – Decommissioning strategy DEDP2 – Decommissioning plan DEDP3 – Considering decommissioning during design and operation
Report author	Gary McMeekan

This report presents the findings of our detailed assessment of the integrated waste strategy (IWS) that supports Hitachi-GE's proposed UK Advanced Boiling Water Reactor (UK ABWR). An IWS should:

- be concise, strategic and a communication tool, with a focus on how wastes will be managed now and over the site lifetime
- set out what challenges lie ahead and when they need to be addressed

We have concluded that:

¹ Process and Information Document for Generic Assessment of Candidate Nuclear Power Plant Designs, Version 2, Environment Agency, Mar 2013.

<http://webarchive.nationalarchives.gov.uk/20151009003754/https://www.gov.uk/government/publications/assessment-of-candidate-nuclear-power-plant-designs>

Latest version is Process and Information Document for Generic Assessment of Candidate Nuclear Power Plant Designs, Version 3, Environment Agency, October 2016.

<https://www.gov.uk/government/publications/assessment-of-candidate-nuclear-power-plant-designs> .

Note - no material changes between revisions.

² Regulatory Guidance Series, No RSR 1: Radioactive Substances Regulation – Environmental Principles, Version 2), Environment Agency, April 2010.

https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/296388/geho0709bqsb-e-e.pdf

- Hitachi-GE has provided an acceptable waste strategy for all waste streams that a UK ABWR will typically produce. The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports for individual waste streams and disposability (Environment Agency, 2017a, 2017b, 2017c and 2017d).
- Hitachi-GE's IWS, in conjunction with its other submissions, will help to optimally protect human health and the environment. The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports on radiological assessments to people and the environment (Environment Agency, 2017e and 2017f).
- The IWS is consistent with recent government policy statements (DECC, 2014) and current regulatory expectations.
- Hitachi-GE has appropriately demonstrated that the design of the UK ABWR to ensure waste arisings and impacts to people and the environment are minimised from decommissioning the UK ABWR.

Any 'strategy' that relates to how aspects of a nuclear facility should be operated, which is included in a submission for GDA, has limitations where the submission relates to a 'generic site' and does not identify a future operator of that site. Clearly for a 'generic site' for GDA, it would be unreasonable for regulators to expect these issues to be fully resolved. Therefore, we consider this to be addressed via two assessment findings.

Assessment Finding 1: A future operator shall provide details of how the proximity principle has been applied in its demonstration of best available techniques for solid and incinerable liquid wastes before it starts active commissioning of the UK ABWR.

Assessment Finding 2: If appropriate, a future operator shall produce an assessment of best available techniques that covers all of its sites, noting economies of scale and other efficiencies in disposal of solid and incinerable liquid wastes across all of its sites before it starts active commissioning of the UK ABWR.

1. Introduction

Guidance on our generic design assessment (GDA) process (process and information document (P&ID), was published in March 2013 (version 2) and updated in October 2016, (version 3) (Environment Agency, 2016). Table 1, Item 4 of the P&ID requires the requesting parties (RPs), among other things, to:

- identify the strategic considerations with respect to radioactive waste management which underpin the design
- describe how radioactive wastes and spent fuel will arise throughout the facility's life cycle (including decommissioning) and plans for how they will be managed to encompass:
 - sources of radioactivity and matters which affect wastes arising
 - gaseous, aqueous and other wastes

We expect new nuclear power plant designs to be developed in line with a radioactive waste and spent fuel strategy that seeks to:

- minimise the production of radioactive waste
- manage unavoidable wastes and spent fuel so as to achieve an optimal level of protection for people and the environment

Our radioactive substances regulation environmental principles (REPs) (Environment Agency, 2010) set out the matters that this type of strategy should take into account. For new nuclear power plant designs, the strategy also needs to be consistent with recent government policy statements (DECC, 2014) that:

- the disposal of intermediate level radioactive waste (ILW) to a future geological repository, from any new nuclear power stations, is unlikely to occur until late this century
- any nuclear power stations that might be built in the UK should proceed on the basis that spent fuel will not be reprocessed

For decommissioning, in line with government policy (DECC, 2009b), we expect:

- the radioactive waste and spent fuel strategy to address decommissioning
- the design to use the best available techniques (BAT) to:
 - facilitate decommissioning
 - minimise arisings of decommissioning waste
 - minimise the impacts on people and the environment of decommissioning operations and the management of decommissioning waste

We carry out our assessment in 2 stages:

- Preliminary assessment – we examine the outline details of the RP's submission to find out if further information is needed, if there are any issues that are obviously unacceptable, or if there needs to be any significant design modifications.
- Detailed assessment – we examine the submission in detail to decide initially if we might issue a statement of design acceptability. We will only make our final decision after we have consulted the public and considered the responses we receive.

Hitachi-GE submitted its UK ABWR design for GDA in April 2014. We published the findings of our preliminary assessment in August 2014 (Environment Agency, 2014). The documents that make up the GDA submission are hosted on Hitachi-GE's website http://www.hitachi-hgne-uk-abwr.co.uk/gda_library.html.

2. Assessment

2.1. Assessment methodology and process

The basis of our assessment was to:

- examine and gain understanding of the IWS and its supporting documents
- hold technical meetings with Hitachi-GE, the RP, to clarify and improve our understanding of the information presented and to identify and explain any concerns that we had with that information
- raise Regulatory Observations (ROs) and Regulatory Queries (RQs) where we believed information provided by the requesting party was insufficient or required clarification, although none were raised relating to the IWS
- assess the IWS provided by the RP using our internal guidance and regulatory experience and decide if the chosen strategy will minimise the production of radioactive waste and manage unavoidable wastes so as to achieve an optimal level of protection for people and the environment
- decide on any GDA Issues or assessment findings to carry forward from GDA

2.2. Assessment objectives

We started our assessment with 3 key questions:

- Does the IWS likely cover all waste streams that a UK ABWR would typically produce?
 - The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports for individual waste streams and disposability (Environment Agency, 2017a, 2017b, 2017c and 2017d)
- Will the IWS help to optimally protect human health and the environment?
 - The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports on radiological assessments to people and the environment (Environment Agency, 2017e and 2017f)
- Is the IWS consistent with government policy, regulatory expectations and current industry good practice?

2.3. Assessment limitations and scope

Any 'strategy' that relates to how aspects of a nuclear facility should be operated, which is included in a submission for GDA, has limitations where the submission relates to a 'generic site' and does not identify a future operator of that site. In the case of waste management, there are 2 main areas where the information submitted for GDA is, by necessity, likely to be less detailed than that we would expect for an operational facility.

Firstly, proximity of disposal: as the submission for GDA relates to a 'generic site' it could never be clear where the most suitable disposal facility for a given waste stream is relative to the UK ABWR in geographical terms. For example, for low level radioactive waste (LLW), it is possible that a suitable disposal facility may be located closer to the eventual site than the Low Level Waste

Repository (LLWR) near Drigg in Cumbria. Secondly, there are commercial factors which may influence the choice of disposal route for a particular waste and questions like “does the eventual operator have multiple, similar plants?”, “are there economies of scale to be considered in a holistic demonstration of BAT?”, “could the eventual operator enter into a commercial arrangement to secure more proximate disposal?” and so on have to be considered. Clearly for a ‘generic site’ for GDA, it would be unreasonable for regulators to expect these issues to be fully resolved. Therefore, we consider this to be 2 distinct assessment findings.

Assessment Finding 1: A future operator shall provide details of how the proximity principle has been applied in its demonstration of best available techniques for solid and incinerable liquid wastes before it starts active commissioning of the UK ABWR.

Assessment Finding 2: If appropriate, a future operator shall produce an assessment of best available techniques that covers all of its sites, noting economies of scale and other efficiencies in disposal of solid and incinerable liquid wastes across all of its sites before it starts active commissioning of the UK ABWR.

We have undertaken a detailed review of the RP’s IWS and the documents that support it. The purpose of an IWS is to set the strategy for how wastes will be managed at all stages of a nuclear power station’s ‘life’, from construction, to operation and then to final decommissioning.

The IWS sets out, in broad ‘strategic’ terms, how the RP intends to comply with legal obligations and industry good practice as they relate to waste management. The strategy gives consideration to the requirements of environmental legislation such as the Environmental Permitting Regulations 2016 and industry good practice, such as the application of the waste hierarchy. Hitachi-GE has set out its waste hierarchy in Decommissioning Topic Report: Decommissioning Waste Management and this has been reproduced as Figure 1 below.

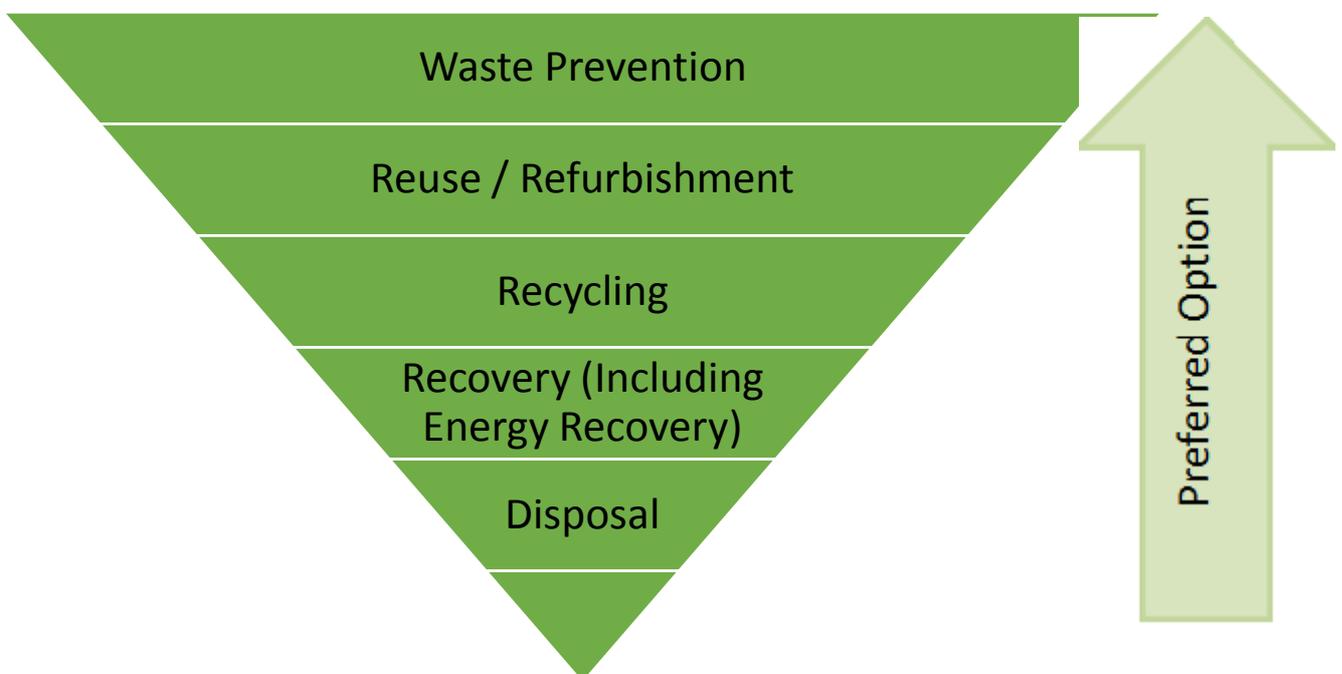

Figure 1. Schematic representation of the waste hierarchy

2.4. Hitachi-GE documentation

We reviewed the following documents to produce this report (Table 1):

2.5. Integrated waste strategy

The RP's IWS outlines its current strategy for managing radioactive and non-radioactive waste, including spent fuel arising from constructing, operating and decommissioning the UK ABWR. The strategy is supported by:

- radioactive waste management arrangements
- a decommissioning strategy
- methodologies to assess BAT and to define the approach to optimisation
- impact assessments for humans and wildlife

The IWS has been derived for a single reactor unit situated at a generic site. The extent of the strategy covers:

- solid radioactive wastes during operation and decommissioning
- solid non-radioactive wastes produced during construction, operation and decommissioning
- liquid radioactive wastes during operation and decommissioning
- liquid non-radioactive wastes produced during construction, operation and decommissioning
- gaseous radioactive wastes during operation and decommissioning
- gaseous non-radioactive wastes produced during construction, operation and decommissioning
- spent fuel, including the final core off-load during decommissioning

The spent fuel management strategy that has been adopted is not to reprocess but to store, package and appropriately dispose of spent fuel when a disposal route becomes available which is consistent with the UK government 'base case' (DECC, 2011).

The first principle of the RP's IWS is to apply the waste management hierarchy to all wastes and that this should be fundamental when considering subordinate strategies and processes. The IWS also sets out principles that propose to minimise the amount of waste created during construction, operation and decommissioning by using BAT to identify optimised solutions.

The IWS seeks to apply the concentrate and contain principle to individual radioactive waste streams, including the balance between liquid and gaseous discharges and the generation of solid waste streams. The 'concentrate and contain' option involves trapping the radioactivity in a solid, concentrated form for storage and eventual disposal rather than the 'dilute and disperse' option that involves the direct discharge of gaseous or liquid radioactivity into the environment (DECC, 2009a).

The UK government remains committed to the policy of geological disposal, for the reasons set out in the Committee on Radioactive Waste Management's (CoRWM) document 'Managing Radioactive Waste Safely' (CoRWM, 2006) and subsequent UK government policy documents on radioactive waste management. The European Directive establishing a framework for the responsible and safe management of spent fuel and radioactive waste recognises that deep geological disposal represents the safest and most sustainable option as the end point for managing high level waste and spent fuel considered as waste. The UK government continues to favour an approach to siting a geological disposal facility (GDF) that is based on the willingness of local communities to participate in the siting process. The UK government considered what lessons could be learned from the operation of the siting process since 2008. To support this consideration, the UK government conducted a 'Call for Evidence' in May 2013, to enable a wider range of stakeholders to input into its review. In June 2013, the current CoRWM issued a statement reiterating its commitment to geological disposal. The Welsh government has decided to adopt a policy for geological disposal for the long-term management of higher activity radioactive waste (Welsh government, 2015).

To take this into account, the Office for Nuclear Regulation (ONR), the Environment Agency and the Scottish Environment Protection Agency (SEPA) have developed a joint guidance document on the management of higher activity radioactive waste (available at <http://www.onr.org.uk/wastemanage.htm>)³. These specify the production, content, maintenance and review of radioactive waste management cases (RWMCs). The RWMC should demonstrate the long-term safety and environmental performance of the management of higher activity radioactive waste from generation to conditioning into a form that will be suitable for storage and eventual disposal. The requesting party has made reference to its RWMC in the IWS.

Solid radioactive waste, which has been produced after applying the waste hierarchy and minimised using BAT, will be stored on site in dedicated buildings pending disposal at an appropriately permitted facility. In the case of lower activity wastes, disposal will be to an appropriately permitted facility as soon as is practicable. In the case of higher activity wastes, this will be to the geological disposal facility (GDF) once that is available, which is consistent with recent government statements (DECC, 2014).

2.6. Matters specific to decommissioning

The IWS summarises the waste management strategy that should be employed when the UK ABWR is decommissioned. It acknowledges that the limits within an environmental permit during the decommissioning phase of a nuclear power station's 'life' are likely to be different to those in operation and suggests that an eventual operator takes note of this. It lists which systems will no longer be required as soon as electricity generation ceases and identifies these as candidates for prompt decommissioning. It also lists the systems that the UK ABWR used during operation, which will be critical to sustaining decommissioning activities. These include heating, ventilation and air conditioning (HVAC), liquid effluent systems and solid waste facilities.

³ This guidance has also been endorsed by Natural Resources Wales.

An inventory of the solid wastes that will be produced during decommissioning is presented in Appendix B of Decommissioning Topic Report: Decommissioning Waste Management. Additionally, estimates of liquid and gaseous wastes are given in the same document at Table B-6 and Table B-9, respectively. Although only a summary of the decommissioning strategy is provided within the IWS, we have also reviewed Revision C of Chapter 31 of the pre-construction safety report (PCSR) where the details that implement the strategy are contained. We have also reviewed the RP's 'Radioactive Waste Management Arrangements', which provide greater detail on how decommissioning wastes will be managed (see Table 1).

With ONR, we have requested further information from Hitachi-GE on decommissioning for consideration in ONR's Step 4 assessment and our assessment work (RQ-ABWR-0825, RQ-ABWR-0826 RQ-ABWR-0827 and RQ-ABWR-0833). These requests are summarised in Table 2. We requested further detailed evidence to be provided in GDA on decommissioning to demonstrate that the UKABWR design has been optimised for decommissioning. We note that this would also assist any future operator in providing a decommissioning and waste management plan.

Table 2. Summary of regulatory queries relating to decommissioning.

RQ Number	Title	Further information requested
RQ-ABWR-0825	Optimisation of Future Commitments	<p>Clarify how the design of the spent fuel pond will enable and not preclude future management options for size reducing the reactor pressure vessel.</p> <p>Provide evidence to show that the final batch of spent fuel can be transferred promptly from the spent fuel pond.</p>
RQ-ABWR-0826	Decommissioning of Large Items	<p>Systematically identify all large, heavy and contaminated items within the turbine building (T/B).</p> <p>Show that the design and operating mode of large items in the T/B will not pose a risk to decommissioning.</p>
RQ-ABWR-0827	Decommissioning and the requirements of RO-ABWR-0057	<p>Provide evidence that the requirements of RQ-ABWR-0057 (relating to probabilistic safety assessment) have been complied with, with respect to decommissioning.</p>
RQ-ABWR-0833	Optimisation in Decommissioning	<p>Provide evidence to show that the UKABWR design and operating philosophies have been systematically and comprehensively challenged, to identify all reasonably practicable improvements to optimise:</p> <ul style="list-style-type: none"> the scale and difficulty of decommissioning that will be required at the end of the station's operational life incorporation of design features to enable the required decommissioning activities to be carried out without unnecessary risks to safety and the environment <p>Provide evidence to demonstrate how relevant good practice has been identified and applied</p>

		in the context of decommissioning specifically with regard to the design of the UKABWR
--	--	--

A workshop was held in July 2016 to discuss progress in this area and Hitachi-GE has provided supporting evidence in a series of topic reports (TR):

- TR 1: Decommissioning strategy
- TR 2: Design for decommissioning
- TR 3: Decommissioning plan
- TR 4: Decommissioning techniques
- TR 5: Impact of construction techniques on decommissioning
- TR 6: Decommissioning waste management
- TR 7: Decommissioning safety assessment

At the time of writing our consultation documents we had not received all documentation associated with Hitachi-GE's decommissioning case, we, therefore, could not assess if the UK ABWR had been designed to facilitate decommissioning and including the following potential GDA issue in our consultation:

Potential GDA Issue 1 – Decommissioning of the UK ABWR.

We require Hitachi-GE to: Provide sufficient evidence to demonstrate that the UK ABWR has been designed to facilitate decommissioning and hence to minimise associated waste and impacts on people and the environment from decommissioning operations

We have now received all the documents and have assessed them. We have also engaged with Hitachi-GE through workshops and meetings, in collaboration with ONR, to raise RQs and discuss the decommissioning case. We have concluded that Hitachi-GE has appropriately demonstrated that the design of the UK ABWR to ensure waste arisings and impacts to people and the environment are minimised from decommissioning the UK ABWR.

Therefore, this potential issue is now closed.

2.7. Compliance with Environment Agency requirements

Table 3. Compliance with Environment Agency requirements.

P&ID Table 1 Section or REP	Compliance comments
Table 1, Item 4	Paragraphs 1 and 2 Compliant.
RSMDP1	Radioactive substances strategy Compliant.
RSMDP3	Use of best available techniques to minimise waste Compliant
DEDP1	Decommissioning strategy Compliant
DEDP2	Decommissioning plan Compliant

DEDP3	Considering decommissioning during design and operation Compliant
-------	--

3. Public comments

Hitachi-GE received 5 public comments up to 15 August 2017 concerned with strategic waste management. On 13 February 2017 Hitachi-GE received a comment regarding the proposed management of HAW. Hitachi-GE responded to clarify that on-site storage for approximately 150 years followed by disposal in a GDF for HAW is based on UK government policy and is the preferred solution for these types of waste.

4. Conclusion

We have concluded that:

- Hitachi-GE has provided an acceptable waste strategy for all waste streams that a UK ABWR will typically produce. The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports for individual waste streams and disposability (Environment Agency, 2017a, 2017b, 2017c and 2017d).
- Hitachi-GE's IWS, in conjunction with its other submissions, will help to optimally protect human health and the environment. The details underpinning the IWS in this respect are considered in greater detail in our relevant assessment reports on radiological assessments to people and the environment (Environment Agency, 2017e and 2017f).
- The IWS is consistent with recent government policy statements (DECC, 2014) and current regulatory expectations.
- Hitachi-GE has appropriately demonstrated that the design of the UK ABWR to ensure waste arisings and impacts to people and the environment are minimised from decommissioning the UK ABWR.
