Subject: Gas generatio or Generation of gas

REDACTED

REDACTED REDACTED REDACTED

Do at least consider parallel investment in Anaerobic Digestion plant for the use of parts of domestic waste, recycled paper and cardboard, garden waste, sewage and animal slurry to produce "Bio Gas" to improve security of gas supply, alongside these proposed new generating stations. After all this is already part of the "Waste Policy" and would reduce the need for "Land Fill"

The resultant CO² from both AD & combustion could be fed into large "poly tunnels" to improve the photosynthesis of food crops and the security of production so as to use rather than have to store the CO². The digestate can also apparently provide a reasonable alternative to chemical fertilizer and reduce leaching effects in water courses
